7. Conclusion		36
Annexure I	: River System Details	37
Annexure II	: Index Map of River Basins	42
Annexure III	: Existing Hydro-met Stations	43
Annexure IV-A	: District-wise Monthly Rainfall Statistics	55
Annexure IV-B	: District-wise Monthly Rainfall Graphs	58
Annexure V-A	: Season-wise Average Rainfall Statistics	68
Annexure V-B	: Station-wise Monthly Monsoon Rainfall	69
Annexure VI	: Comparison of last five years Rainfall	71
Annexure VII	: Station-wise Monsoon River Levels	82
Annexure VIII-A	: Flood levels of North Bengal Rivers	84
Annexure VIII-B	: Flood levels of South Bengal Rivers	95
Annexure IX-A	: Monsoon Dam-Barrage Statistics	116
Annexure IX-B	: Monsoon Dam-Barrage Graphs	117
Annexure X	: List of Signal Imposed	124
Annexure XI-A	: Primary Damages due to Very Severe Cyclone 'Yaas'	125
Annexure XI-B	: Flood Damage Report during the year	128
Annexure XII	: Flood Control Rooms under I.&W. Dept.	226

PREFACE

West Bengal being the lowermost riparian state of Ganga Basin and situated at the foothills of several Himalayan rivers of Brahmaputra Basin, the problem of flood management and drainage is quite acute here. Most of the rivers in the State originate from outside of the State boundary and thus they are either inter State or International category. The State has often witnessed destructive floods, even without any substantial rainfall within the geographical limits of its own. Along-with flood and water logging, various allied problems like bank erosion, embankment breach, drainage congestion, and cyclonic storm has often accentuated the flood disaster. The coastal areas along the Sundarban delta, which happens to be the largest delta of the world, often experience high tidal surges resulting in severe erosion and inundation to the country sides. In a nutshell, West Bengal has about 42.5% of its geographical area as flood prone, happens to be one of the prime floods affected States in the country.

The flood and water related disasters and associated problems in West Bengal has become almost an annual feature. Many parts of the State get onslaught of flood waters almost every year resulting in severe loss to standing crops, cattle and properties. Statistically, this flood fury has increased during the last two decades.

To protect the country-side from flood ingress during peak monsoons and high tide, flood embankments are constructed along the vulnerable river banks. These embankments; constructed in various districts of the State in general and in the deltaic Sundarbans in particular, are used as prime communication links, particularly during periods of natural calamity for safe passage of people and relief materials. It virtually serves as vital lifeline to the affected areas during adverse situation. Disruption of such communication links due to failure by way of subsidence and sudden breach during flood creates havoc, bringing the life of affected areas to a grinding halt as the areas become devoid of basic amenities of life.

Factors such as intensity and duration of rainfall, sedimentation of river bed, imprudent reservoir control, tidal lockage, obstruction and encroachment in natural waterways play vital role in the occurrence of flood. Basin-wise study of flood factors and evaluation of flood hazards are indispensable for chalking out future effective plans for flood control and management measures. Accordingly, Irrigation & Waterways Directorate at the end of every flood season ritually brings out an Annual Flood Report incorporating the history of rainfall patterns of the monsoon season, district rainfall records, and major river gauge levels across the State, reservoir inflow-outflows and major flood events of the year.

Throughout the year, overall rainfall of the State is 20.6% above normal. The rainfall in the north is 7.1% less than normal while in the south, it is 35.1% above normal. Incessant and unprecedented rainfall in frequent spells in South Bengal made the rivers to flow in high stages and as a consequent several damages occurred. Before the onset of monsoon, the State has experienced very severe cyclone 'Yaas'. Damages has also occurred at vulnerable spots of the flood embankments, river and sea protective works mainly in the coastal districts of West Bengal. However, the restoration works are well undertaken by the Department both for 'Yaas' and for the damages that occurred during the normal flood season period of 2021.

ANNUAL FLOOD REPORT, 2021

RIVER NETWORK IN WEST BENGAL

1. INTRODUCTION

Geographically, the State of West Bengal is capped by the Himalayan snow-peaks in the North and frothy sea of Bay of Bengal on the South. The terrain is a combination of land varying from hilly regions in the north and partly high plateau in the south-west to the Gangetic alluvial plains in the rest areas. The State is beset with extensive network of rivers, their tributaries, rivulets, jhoras, irrigation canals, wetlands, ponds, beels and low-lying pockets of water bodies. With the Tropic of Cancer passing across it, the State is situated in between $21^{\circ}31'$ & $27^{\circ}13'14''$ North Latitudes and $85^{\circ}45'20''$ & $89^{\circ}53'$ East Longitudes.

Salient features of West Bengal are given below in seriatim to give an outline of the flood situation of the State.

Salient Features:

Geographical area of State	:	88,752 sq. km.
Population (as per last census, 2011)	:	9.13 crores
No. of Districts	:	23
Total no. of blocks	:	341
No. of flood susceptible districts	:	19
No. of Vulnerable blocks	:	198 (in Flood & Tidal inundation)
River basins (with CWC code)	:	Ganga (2A), Brahmaputra (2B), and Subarnarekha (6).
Number of River Sub-basins	:	39
Total Catchment area	:	1,80,628 sq. km.
Catchment area outside of the State	:	91,876 sq. km. (outside of West Bengal but within India: 57624 sq.km. & outside of country: 34,252 sq.km.)
Annual average rainfall	:	1,826 mm (Northern part: 2750 mm, Alluvial & Deltaic plain: 1650 mm, Western plateau: 1450 mm)
Total flood prone area	:	37,760 sq. km.
Area already protected	:	35, 380 sq. km.
Length of Embankment	:	10,584 km.
Length of Drainage Channel	:	8,409 km.
Length of erosion protection work other than embankments	:	2,389 km.
Length of sea wall	:	67 km.
Total number of Outfall sluices	:	2,781
Number of Pumping stations	:	20
Surface water potential	:	136.9 BCM
Ground water potential	:	23.6 BCM

2. RIVER SYSTEMS AND FLOOD PROBLEMS

West Bengal, a part of Bengal Delta, has a long-recorded history of flood. At present **42.55%** of total area of the State is susceptible to flood. Reason is the landmass of the State was formed by the Ganga-Padma system of rivers through the delta building process of which flood being the main carrier of sediments, the bulk of fluvial deposit, in huge volumes. The highest affected area as recorded in 1978 is about 30,607 sq. km and in 2000, it is about 23,971 sq. km.

Most of the rivers in the State are either Inter-State or International in character. The flood problems of the State are of different nature at different regions which are describing below.

2.1. In North Bengal:

In North Bengal, rivers viz. **Teesta, Torsa, Jaldhaka, Raidak** and **Sankosh** after originating in the neighbouring countries of Bhutan and Tibet and the State of Sikkim, flow downwards through the districts of Darjeeling, Kalimpong, Jalpaiguri, Alipurduar and Coochbehar to meet the River Brahmaputra at different locations in Bangladesh, another neighbouring country. The combined catchment of all this system of rivers upto the international border is 37,545 sq. km.

The rivers of the districts of Uttar Dinajpur and Dakshin Dinajpur namely, **Dauk, Nagor, Kulik, Tangon** and **Punarbhaba** after originating at Bangladesh pass through these districts and either directly or indirectly contribute catchment discharges into the River Ganga-Padma in Bangladesh after the Farakka Barrage. River **Atreyee**'s major upstream inflow from Bangladesh, runs across Dakshin Dinajpur and outfalls into River Brahmaputra in Bangladesh again. The combined catchment area of the river system up to the international border is 8,873 sq. km.

The southern part of district Malda through which the River **Ganga** flows receives its flood water from about 11 States and is battered by the run-off flow generated from these vast areas. Ultimately the river flows down the Farakka Barrage to Bangladesh. The western side of the Malda district receives floodwater mostly from neighbouring country of Nepal and State of Bihar through a network of rivers called **Mahananda** and **Fulahar**. Fulahar, after flowing straight south, joins with Ganga upstream of Farakka barrage while Mahananda turns towards south-east and after bifurcating Malda, outfalls into River Ganga-Padma at downstream of Farakka Barrage in Bangladesh. The combined catchment of Mahananda-Fulahar system is 19,342 sq. km.

Major contributing factors to flood in North Bengal regions are the run-off because of heavy local rainfall, discharge of upper basin areas and also outfall condition in the neighbouring countries. The Mahananda and most of the rivers of Uttar and Dakshin Dinajpur districts get stagnated when the Ganga upstream and downstream of Farakka Barrage rules high thereby not allowing drainage of flood discharge during that period.

2.2. In South Bengal:

There are certain distinctive features of drainage condition which give rise to flood situation in south Bengal. The flood in this zone becomes voluminous because of the shape of the catchment area, its steep slope starting from a high-level plateau area and sloping sharply down to a flat terrain near the

outfall of limited capacity. This feature is again adversely affected by tidal conditions as is generally noticed in the month of September, the likely month of occurrence of flood.

Basin-wise there are quite a number of river systems on the right bank of the river Bhagirathi-Hooghly like **Pagla-Bansloi, Dwarka-Brahmani, Mayurakshi-Babla** and **Ajoy**. These rivers together drain out flood water from an area of 18,177 sq. km, spread over the State of Jharkhand (the Chotanagpur Plateau) and the districts of Birbhum, western part of Murshidabad, West and East Burdwan, and finally outfall into river **Bhagirathi**. Carrying capacity of the river Bhagirathi is only 25% of the combined peak flood discharges generated from these basins because of simultaneous heavy rainfall, as it occurred during the flood of September 2000. In this vast tract of land there is one major reservoir, that is, Massanjore Dam over river **Mayurakshi** which interferes the flood discharge of only 11% of aforesaid combined catchments.

On the left bank of the Bhagirathi River system the **Bhairab-Jalangi-Sealmari** group of rivers originate from Ganga-Padma at Akherigunj in Murshidabad district and meet the Bhagirathi at Swarupgunj in Nadia District. This system of rivers between them drains a total area of 2,537 sq. km. of Murshidabad and Nadia districts. Generally, this area suffers from flood because of three reasons – (i) high intensity rainfall in the basin area itself (ii) inflow of flood water from Ganga-Padma at its high spate and (iii) drainage congestion at its outfall because of high stage of river Bhagirathi during high tide.

In the **Damodar-Barakar** River system, the rivers originate at Chotanagpur plateau of Jharkhand and flows down the plains of West Bengal to outfall into the **Rupnarayan-Hooghly** system through two channels namely **Mundeswari** and **Amta Channel**. The catchment area upto **Durgapur Barrage** is 18,026 sq. km. as against total catchment of 24,341 sq. km. In this catchment area there are only 4 (four) reservoirs having a storage capacity of 1.21 BCM. The original concept of flood storage was to have an area reserved for storing a volume of 3.58 BCM. Thus, with this limited flood storage capacity the storage dams at present can modify only the peak flood discharge. Any discharge above 70,000 cusecs downstream of Durgapur barrage may cause flood depending on the outfall condition of the Mundeswari at Harinkhola.

The **Shilabati-Darakeswar** and **Kangsabati-Kaliaghrai** river systems which have combined catchment areas of 16,938 sq. km spread out in the districts of Purulia, Bankura, Jhargram, Paschim and Purba Medinipur outfall into river **Rupnarayan** and **Haldi** respectively which finally meet river Hooghly. The **Kangsabati-Kumari dam** at Mukutmanipur, Bankura intercepts flood discharge of only 22% of the aforesaid combined catchment area. In this basin spillway discharge from Kangsabati dam above 50,000 cusecs may cause flood at lower reaches downstream of **Mohanpur Anicut** near Midnapore Town depending on tidal condition of the outfall and rainfall in the uncontrolled catchment downstream of Kangsabati dam.

The **Mathabhanga-Churni-Ichamati** system of rivers originate at the Mathabhanga off-taking from Ganga-Padma downstream of Farakka Barrage in Bangladesh and on reaching West Bengal at Majdia in Nadia district, bifurcates in two branches (i) the Churni flowing on South-Westerly direction meeting the Bhagirathi at Ranaghat and (ii) the other branch namely, the Ichamati flowing on South-Easterly direction to meet Bay of Bengal through the

creek of Raimangal. The main flood situation in this area arises because of inflow from Ganga-Padma (when it rules high), rainfall in the own catchment area and also tide lockage. In 2000 flood, a very unusual situation arose where the Bhagirathi transferred a large volume of its floodwater to this basin area by breaching its embankments at several places.

Index map of river system in North Bengal and South Bengal is presented below. The inventories of rivers, tributaries, branch channels within the sub basins have been presented in **Annexure-I**.

2.3. Historical record of flood:

Historical record of flood available in West Bengal from 1960 till present year i.e. 2021 is given below:

HISTORICAL RECORD OF FLOOD IN WEST BENGAL		
Flood affected Area (in Sq. Km.)	Years during which Flood occurred (1960 to 2021)	Total Number of Years
Below 500	1985, 1989, 1992, 1994, 1997, 2001, 2002, 2005, 2006, 2010, 2012, 2013, 2014, 2016, 2018 & 2019	16
Between 500 – 2,000	1962, 1963, 1964, 1965, 1966, 1972, 1975, 1996, 2003, 2004, 2011, 2015 & 2020	13
2,000 – 5,000	1960, 1961, 1967, 1969, 1970, 1974, 1976, 1980, 1981, 1982, 1998, 2009, 2017 & 2021	14
5,000 – 10,000	1973, 1977, 1991, 1993, 1995, 2007 & 2008	7
10,000 – 15,000	1968, 1979, 1983, 1990 & 1999	5
15,000 – 20,000	1971, 1986, 1987 & 1988	4
Above 20,000	1978, 1984 & 2000	3

3. DETAILS OF RIVER BASINS AND SUB-BASINS

The State can be demarcated into three distinct drainage basins namely Ganga (CWC basin code no. 2A), Brahmaputra (CWC basin code no. 2B) and Subarnarekha (CWC basin code no. 6) basins respectively. Ganga basin has been further divided into two parts namely Bhagirathi lower & others and Damodar. These three main river basins can be divided into sub-basins having individual catchment of their own. Index maps of different river sub-basins and basins are presented in **Annexure-II**.

3.1. BRAHMAPUTRA BASIN

The rainfall in the northern region of the State is generally high. The ground slope is steep, particularly in the Sub-Himalayan regions of the northern districts. Most of these northern districts belong to Brahmaputra basin. This system consists of a total area of 10,584 sq. km., nearly 12% of the geographical area of the State. This basin area is interspersed with a large number of drainage channels, which join the main drainage arteries of the regions like the rivers Teesta, Torsa, Raidak, Jaldhaka etc. All these rivers originate from the Himalayas in neighbouring countries Bhutan, Sikkim and Tibet, and flow across the Terai region and reach the plains of West Bengal and then flow to Bangladesh joining ultimately the Brahmaputra in Bangladesh. The catchment area distribution of this basin and sub-basins bounded within different neighbouring States and countries has been presented in the following table.

Distribution of Catchment Area of River Basins & Sub-Basins of West Bengal									
CWC Basin Code	River Basin	Sub-Basins	CATCHMENT AREA (Sq. Km.)						TOTAL (Sq. Km)
			Assam	Sikkim	West Bengal	Bangla-desh	Bhutan	Tibet	
2B	BRAHMAPUTRA								
	Brahmaputra Lower	Jaldhaka		76	3916	351	959		5302
		Raidak			246		4590	16	4852
		Sankosh	175		162		9734	75	10146
		Teesta		7000	3012	12		29	10053
		Torsa			3248		2363	1581	7192
		Sub-Total	175	7076	10584	363	17646	1701	37545

3.1.1. Sankosh Sub-basin

The river Sankosh with its origin in Bhutan is the eastern most river of Brahmaputra River basin. It serves as the boundary between the two states West Bengal and Assam. It joins with Raidak-II and finally falls into Brahmaputra in Bangladesh by name Gangadhar. The length of Sankosh in West Bengal is 24 km. The total catchment area of this river sub-basin is 10,146 sq.km.

3.1.2. Raidak Sub-basin

It originates in Mt. Akungphu at an altitude of 6,400 m. in Bhutan. The river Raidak then bifurcates into two channels namely Raidak-I and Raidak-II at Bhutanghat, close to Indo-Bangladesh border. Raidak-I joins the united stream of Torsa and Kaljani, while Raidak-II is joined by Sankosh and finally outfalls into Brahmaputra in Bangladesh by the

name Gangadhar. The length of Raidak-II is around 50 km in West Bengal. The total catchment area of Raidak-II river sub-basin is 4,852 sq.km.

3.1.3. Torsa Sub-basin

The river Torsa originates in Chumbi Valley of southern Tibet at an altitude of 7,065 m. It flows through Tibet, Bhutan, West Bengal and Bangladesh. Below Hasimara Bridge on NH-31, it bifurcates into two channels namely Sil-Torsa and Char-Torsa. They reunite at PatlaKhowa forest. The river passes by the Coochbehar town and is joined by river Kaljani and Raidak-I. The combined flows outfalls into Brahmaputra near Nageswari at Rangpur in Bangladesh. The total length of this river is 222 km out of which 74 km is situated within West Bengal. The total catchment area of this river sub-basin is 7,192 sq.km.

3.1.4. Jaldhaka Sub-basin

The river Jaldhaka has its origin at Bitang Lake in Sikkim at an altitude of 4,400 m. It flows through Sikkim, Bhutan, West Bengal and Bangladesh. After the river is joined by a number of streams and tributaries; both in mountainous and sub-mountainous regions, it finally flows into river Dharala and the combined system, by the name Dharala ultimately outfalls into Brahmaputra in Bangladesh. The total length of this river is 192 km out of which 122 km is situated within West Bengal. The total catchment area of this river Sub-basin is 5,302 sq.km.

3.1.5. Teesta Sub-basin

Teesta, the mighty river of North Bengal originates in the glaciers of North Sikkim at an altitude of 6,400 m and is formed by the union of two streams viz. Lachen and Lachung at Chungthung in Sikkim. It enters West Bengal at Rangpo and upto Mechi, it forms the boundary between West Bengal and Sikkim. Two of its tributaries, Great-Rangeet and Rammam also serve as the natural boundary between the two States. The river finally outfalls into Brahmaputra in Rangpur district of Bangladesh. The total length of this river is 309 km. out of which 103 km. is situated within Sikkim and 121 km. in West Bengal. The total catchment area of this river Sub-basin is 10,053 sq. km. Under '**Teesta Barrage Project**', a barrage has been constructed at Gazoldoba under Jalpaiguri district.

3.2. GANGA BASIN

The two holy rivers - Bhagirathi and Alakananda originating from the glaciers of the Himalayas at an altitude of 7,000 m join at Devprayag and the combined stream is known as the Ganga. It emerges into the plains at Rishikesh in Uttarakhand. After flowing exclusively through Uttarakhand and Uttar Pradesh, it receives the flow of Yamuna, one of its major tributaries near Allahabad. The other major tributaries of Ganga are Ton, Gomti, Ghaghara, Son, Gandak, Kosi and Fulahar. The Ganga forms the boundary between Uttar Pradesh and Bihar for a length of about 110 km and the river then enters Bihar and flows more or less through the middle of the state. After its confluence with the Kosi, the Ganga continues its eastward flows in Bihar for about 40 km.

At Bhagalpur of Bihar, the river begins to flow south-southeast and as it enters West Bengal, the river swings round the Rajmahal hill range. It begins its attrition with the branching away of its first distributary, the Bhagirathi-Hooghly, which goes on to become the Hooghly River after meeting with Jalangi near Nabadwip and ultimately outfalls into the Bay of Bengal near Sagar Island. Just before the border with Bangladesh, the Farakka Barrage controls the flow of the Ganges, diverting some of the water into a feeder canal linked to the Hooghly for keeping it relatively silt-free.

The North-Central, South-Central, Western, Southwestern and Southern parts of West Bengal constitute the Ganga Basin. This basin is largely divided into two major sub-basins namely Bhagirathi lower and Damodar. The total length of the river Ganga from its point of origin to the point where it falls into sea is about 2,575 km. (measured along Bhagirathi and the Hooghly) of which 1,450 km. lies in Uttarakhand and Uttar Pradesh, 110 km along Uttar Pradesh and Bihar border, 445 km. in Bihar and 570 km. in West Bengal.

The Ganga system comprises a total area of 74,575 sq. km. within the state of West Bengal. The catchment area distribution of this basin and sub-basins bounded within different neighbouring states and countries has been presented in the following table.

CWC Basin Code	River Basin	Sub-Basins	CATCHMENT AREA (Sq. Km)						TOTAL (Sq. Km)
			Bihar	Jharkhand	Orissa	West Bengal	Bangladesh	Nepal	
GANGA									
2A	Bhagirathi and Others (Ganga Lower)	Atreyee				1627	2262		3889
		Fulahar	2940			325		2684	5949

3.2.1. Mahananda-Fulhar Sub-basin

The river Mahananda originates from Ghoom near Darjeeling town in the district of Darjeeling. It is bounded on the north by the Himalayas, in the east by the ridges separating it from Teesta river system, the river Ganga on the South and the Kosi river system in the east. The river bifurcates into two channels at Barsoi in Bihar. Out of the two branches one flows through Bihar by the name Fulahar and the other flows through West Bengal as Mahananda. The river Mahananda carrying the flow of four tributaries namely, Nagar, Kalindri, Tangon and Punarbhaba, drains into the river Ganga from the Northwestern side at Godogarighat just downstream of the point where Ganga leaves the boundary of West Bengal. The combined catchment area of these two Sub-basins is 19,342 sq. km. Under '**Teesta Barrage Project**', a barrage has been constructed over **Mahananda** near Siliguri and another pick-up barrage has been constructed over river **Dauk** near Chopra of North Dinajpur district, which is a tributary of Mahananda.

3.2.2. Atreyee Sub-basin

Some rivers like Sahu, Neem, Talma, Chaoai, Panga originating from the high lands in districts of Jalpaiguri and meet together to form Kartowa which then enters into Bangladesh by the name Atreyee. The river Atreyee then bifurcates into two channels namely Dheepa and Atreyee. The Western Channel named Atreyee re-enters into West Bengal in South Dinajpur district covering a length of 40 km in the State. It again enters into Bangladesh and ultimately outfalls into river Jamuna after passing through Chalanbeel. The total catchment area of this river sub-basin is 3,889 sq.km at the point of leaving West Bengal boundary.

3.2.3. Punarbhaba Sub-basin

The river Dheepa after emerging out from Atreyee in Bangladesh, has taken a South - Western course to enter into South Dinajpur district assuming the name Punarbhaba. Covering a length of about 40 km. in the district, it touches the eastern boundary of Malda district and finally

enters into Bangladesh. Further down, Punarbhaba meets the river Mahananda in Bangladesh. The catchment area of this sub-basin is 2,934 sq. km.

3.2.4. Nagar-Kulik, Gamari-Chiramati, Tangon Sub-basins

All these rivers flow through the districts Malda and North Dinajpur and outfall into the river Mahananda. In course of their flow, somewhere they form the boundary either between West Bengal and Bihar or between West Bengal and Bangladesh. Nagar, originating in Bangladesh flows along the boundary of West Bengal and taking a Southeastern course, receives a spill channel of Mahananda and is joined by Kulick, which has also its origin in Bangladesh.

Gamari and Chiramati (or Srimati) are two small rivers that flow through North Dinajpur district before they are united. This combined streams finally outfalls into the river Mahananda. Tangon is a tributary of river Mahananda. It rises in Bangladesh. It flows through the district of North Dinajpur and Malda and meets Mahananda on the boundary of Malda and Bangladesh. The catchment area of Tangon is 2,050 sq. km.

3.2.5. Bhagirathi-Hooghly Sub-basin

Farakka Barrage diverts water from river Ganga into Bhagirathi through a channel known as **Feeder canal** near Tildanga town of Murshidabad district in order to ensure minimum flow in Bhagirathi especially during dry season. This canal flowing parallel to Ganga passes Dhulian and ends just above Jangipur where Bhagirathi takes its own course. Two right bank tributaries namely Pagla and Bansloi outfall into the Feeder canal before it turns into actual Bhagirathi. It has been renamed as river Hooghly as it passes on the eastern side of Hooghly district until it outfalls into the Bay of Bengal near Sagar island.

During its entire course from origin to outfall, Bhagirathi has formed boundaries between the districts of Purba Bardhaman & Nadia, Hooghly & North 24-Parganas, Howrah & Kolkata, Purba Medinipur & South 24-Parganas. River Ajay, Mayurakshi, Damodar (Amta Channel), Rupnarayan and Haldiare the major tributaries on its right bank while river Jalangi and Churni are the major tributaries on its left bank. Some other minor tributaries on its right bank are Khari, Behula, Ghea and Rasulpur. Moreover, there are so many small drainage channels and khals which directly outfall into this river from its both banks thus forming local catchment areas of 5,452 sq.km. The Tolly's Nullah or the Adi-Ganga, as it is sometimes called is a small but important tidal creek draining into the river Hooghly from the left near the city of Kolkata.

One important factor that affects the drainage potential of river Hooghly is the effect of tides. The tide runs rapidly on Hooghly and produces a remarkable example of the fluvial phenomenon known as a '*tidal bore*'. This consists of the head-wave of the advancing tide, hemmed in where the estuary narrows suddenly into the river, and often exceeds 2.1 m. in height. The difference from the lowest point of low water in the dry season to the highest point of high water in the rainy

season is reported to be more than 6 m. It has been observed that the incident of flood devastation in the districts of Purba & Paschim Medinipur, Howrah and Hooghly occur mostly when high flood discharges from Jharkhand districts along-with those from Bankura, Birbhum, Paschim Bardhaman, Purba Bardhaman and Purulia districts of West Bengal synchronizes with high tides in river Hooghly specially during the month of August and September.

3.2.6. Jalangi-Bhairab Sub-basin

The river Jalangi originates from the right bank of the river Padma in Murshidabad district, 165 km. downstream of Farakka. Jalangi is dead for all purposes except during the periods of heavy rain, when it receives water from Padma. The river ends its journey by finally outfalling into the river Bhagirathi near Nabadwip town of Nadia district. The major tributary of Jalangi is river Bhairab that starts its journey from the river Ganga near Lalbag of Murshidabad district. It is now almost a dead channel but during rainy season, it receives water from Padma. Catchment area of Jalangi Sub-basin is 2,537 sq.km.

3.2.7. Mathabhanga-Churni Sub-basin

River Mathabhanga originates from the right bank of the Padma, at Munshiganjin Kushtia district of Bangladesh. It bifurcates near Majdia of Nadia in India, creating two channels. The western course, Churni runs a few km. through Nadia in a south-west direction to meet Bhagirathi and the other course Ichamati, after traversing a length of 20 km in India, enters into Bangladesh near Mubarakpur. The length of Churni is almost 56 km. Catchment area of Mathabhanga-Churni Sub-basin is 2,279 sq.km.

3.2.8. Ichamati- Bidyadhari Sub-basins

After entering into Bangladesh near Mubarakpur, river Ichamati flows for 35 km in Bangladesh and again re-enters into India at Duttaphulia of Nadia. It forms the international border between India and Bangladesh for 21 km. and finally outfalls into river Kalindi of Sundarban area. The length of Ichamati is 208 km. with the catchment area of 2,313 sq. km. within West Bengal and 1,063 sq. km. within Bangladesh. Bidyadhari originates near Haringhata in Nadia district and then flows through Deganga, Habra and Barasat areas of North 24 Parganas before joining the Raimangal River in the Sundarbans. It has been the major drainage system of North 24-Parganas and Kolkata having catchment area of 2,014 sq. km.

3.2.9. Pagla-Bansloi Sub-basins

These rivers originate from the Rajmahal hills in the Sahebganj district of Jharkhand. Flowing eastern across Birbhum district, they entered Murshidabad district as the tributaries of the river Bhagirathi. The combined catchment area of these sub-basins is 2,489 sq. km.

3.2.10. Brahamani-Dwarka Sub-basin

Dwaraka originating in Dumka district of Jharkhand, flows through Birbhum and Murshidabad districts where it joins with Mayurakshi to form Babla which finally outfalls into the river Bhagirathi. Brahamani is the main tributary of Dwarka. It also originates in Dumka district of Jharkhand and flows through Birbhum and Murshidabad districts to meet with Dwarka. There are Baidhara and Deocha barrages across the river Brahamani and Dwarka respectively under the '**Mayurakshi Reservoir Project**'. The total catchment area of this sub-basin is 4,117 sq. km.

3.2.11. Mayurakshi-Babla Sub-basin

River Mayurakshi (or Mor), the major river in Birbhum district, has a long history of devastating floods. It has its source on Trikut hill, about 16 km from Deoghar in Jharkhand state. Several spill channels - the Manikarnika, Kana Mor etc. take off from the Mayurakshi in its lower reaches. All these rivers including river Dwarka flow into the lower pocket of Hijal beel in the district of Murshidabad. The combined flow when starts journey from the beel named as river Babla that finally drains into the river Bhagirathi. The ruling level of Bhagirathi considerably influences the drainage and flood level in the HijalBeel.

Massanjore dam and **Tilpara barrage** have been constructed across this river as a part of 'Mayurakshi Reservoir Project', which is the first major irrigation project in West Bengal after independence. Other important structures of this project situated in Birbhum are Kopai barrage on river Kopai and Kandisala weir over river Bakreswar. The combined flows of Kopai and Bakreswar are called river Kuia which outfalls into Mayurakhshi near Kandi of Murshidabad. Mayurakshi is about 250 km long out of which nearly 100 km passes through West Bengal. The total catchment area of this sub-basin is 5,478 sq.km. River Siddheswari and Noonbeel are two major tributaries of Mayurakshi outfalling into it at 8 km downstream of Massanjore dam and largely contribute the high volume of uncontrolled flood discharge during monsoon.

3.2.12. Ajay Sub-basin

River Ajay originates on a small hill about 300 m high, southwest of Munger in Bihar. It then flows through Jharkhand and enters West Bengal at Simjuri, near Chittaranjan. It forms the border between Birbhum and old Burdwan districts and finally joins the Bhagirathi River near Katwa town of Purba Bardhaman. Total length of the Ajay is 288 km. out of which 152 km. lies in West Bengal. The important tributaries of Ajay are Pathro and Jayanti in Jharkhand, Hinglow in Birbhum and Kunur in Purba Bardhaman district of West Bengal.

There is a barrage across river Ajay constructed by Govt. of Jharkhand at Sikatia. The floods of this river are flashy and of short duration. There are some pockets in the Ajay-Kunur catchment, which suffer from frequent inundation. Large areas of Purba Bardhaman, Birbhum and Murshidabad districts experience inundation due to drainage congestion whenever flood of the Ajay coincides with those

of the Mayurakshi and Dwarka. A dam has been constructed over the tributary Hinglow for the purpose of irrigation in some parts of Birbhum district. The total catchment area of this Sub-basin is 6,093 sq.km.

3.2.13. Khari-Behula-Ghea Sub-basins

Khari river a minor right bank tributary of river Bhagirathi originates from the swampy field of Kanksa-Panagarh region of Purba Bardhaman district and flows mainly eastward and later south-eastward to outfall into river Bhagirathi upstream of Kalna town. Its main tributary is Banka River, which acts as a spill channel of river Damodar, and after flowing almost parallel to Khari, it meets with Khari just before its outfall into Bhagirathi. The catchment area of this sub-basin is 2,268 sq. km.

Behula, also a spill channel of river Damodar originates near Palla village of Purba Bardhaman district and after flowing eastward it outfalls into river Bhagirathi upstream of Balagarh town of Hooghly district. Its main tributary is Gangur river. The catchment area of this sub-basin is 549 sq. km.

Ghea is another spill channel of river Damodar, originating in the Burdwan district and after flowing southward and south-eastward through Hooghly district it outfalls into Hooghly river near Champdani town. The main tributaries of this river are Kana and Kunti having a catchment area of 1,167 sq. km.

3.2.14. Damodar-Mundeswari Sub-basins

River Damodar originating from Palamu hills in Jharkhand and flowing through a length of 541 km between several districts of Jharkhand and West Bengal bifurcates into two channels at Beguahana of Purba Bardhaman district near Jamalpur. One channel carrying dominant flood discharge has been named as river Mundeswari that drains into Rupnarayan at Bakshi of Howrah district. The other channel after passing through Hooghly and Howrah districts as Amta channel carries its discharge and outfalls into the river Hooghly through an outfall sluice near Uluberia.

The river causes floods in its lower reaches in the districts of Purba Bardhaman, Hooghly and Howrah, mainly on the right bank of the river below Beguahana. Earlier known as the 'Sorrow of Bengal' because of its ravaging floods in the plains of West Bengal, the Damodar and its tributaries have been somewhat tamed with the construction of four dams (**Maithon, Panchet, Konar and Tilayia**) under the control of '**Damodar Valley Corporation (DVC)**'. There is another dam at Tenughat across Damodar under the direct control of Government of Jharkhand and in the lower catchment; there are one **barrage at Durgapur** and one **weir at Randiha** under the direct control of Irrigation & Waterways Department, Government of West Bengal.

River Barakar and Bokaro are two major tributaries of Damodar in Jharkhand which meet Damodar from its left bank whereas river Shali in Bankura district of West Bengal is other major tributary situated on its

right bank. Harinkhola, Short-Cut channel, Kana Dwarakeswar, Hurhura khal are other important drainage arteries of this catchment which play important role in draining out flood discharge into river Rupnarayan, having tidal influence. The total catchment area of Damodar sub-basin in Jharkhand is 17,087 sq.km and in West Bengal is 4,325 sq. km. upto Beguahana point. The local catchment area of Mundeswari sub-basin is 1,439 sq.km and that of Amta Channel-Kana Damodar sub-basin is 1,490 sq.km.

3.2.15. Dwarakeswar Sub-basin

Darakeswar river (also known as Dhalkishore) is a major river in the western part of West Bengal. It originates from Tilboni hill of Chhotanagpur Plateau in Purulia district and enters Bankura district near Chatna. It mainly flows southeastward and after entering into Hooghly district it turns south near Arambag town. Its main tributary Gandheswari rising from Bankura district meets Darakeswar near Bankura town. After receiving contributions from other minor tributaries like Arkasha, Berai, and Shankari etc. Darakeswar finally joins with Shilabati at Bandar near Ghatal town of Paschim Medinipur district to form river Rupnarayan. There is proposal of "Darakeswar-Gandheswari Reservoir Project" within this sub-basin. Catchment area of this sub-basin is 4,292 sq. km.

3.2.16. Silabati Sub-basin

Like Darakeswar, river Silabati (also known as Shilai) emerging from hilly terrain of Chhota Nagpur Plateau in the Purulia district, traverses south-eastward through the districts of Bankura and Paschim Medinipur to meet with Darakeswar to form Rupnarayan River. River Joyponda, Ketia, Donai, Kubai and Parang are major tributaries of Shilabati. There is a small pickup barrage constructed across the river at **Kadamdeuli** in Bankura district as a part of 'Kangsabati Reservoir Project'. The catchment area of this sub-basin is 4,088 sq. km.

3.2.17. Kangsabati Sub-basin

The river Kangsabati (also variously known as the Kasai and Cossye) originating from Chhota Nagpur Plateau in the Purulia district and flowing south-eastward, joins with its main tributary Kumari river at Mukutmanipur of Bankura district where a reservoir popularly known as Mukutmanipur dam has been constructed under the '**Kangsabati Reservoir Project**' for the purpose of both irrigation and flood control. An **Anicut** structure built on this river near **Midnapore** town in 1872 was also added to the operations of the project. Further down, after entering into the district of Paschim Medinipur it joins with combined streams of Bhairab Banki and Tarafeni rivers. Both the rivers have barrages over them under the Project. After travelling further east in a tortuous course, it bifurcates into two rivers at Kapastikri of Paschim Medinipur.

Northern branch, known as Old Cossye after flowing through certain distance, further bifurcates into two courses at Daspur of Paschim Medinipur. One course, named as Palaspai khal flow further east to outfall into the Rupnarayan and the main course, known as Durbachati flows

southeasterly along the border of both Medinipur districts to outfall into river Rupnarayan. Old Cossye is also connected with river Silabati through a small channel known as Kanki khal.

The southern course, known as New Cossye, flows further southeasterly direction to meet with river Kaliaghai at Dheubhanga of Purba Medinipur district and forms river Haldi that flows eastwardly into the river Hooghly at Haldia. Kherai and Bakshi khal is the main tributary of river New Cossye. The total length of Kangsabati is around 465 km. The catchment area of this sub-basin is 6,645 sq.km. Very often, lower portion of this sub-basin especially Ghatal area of Paschim Medinipur and Panskura area of Purba Medinipur districts suffer from inundation due to high flood discharge from its uncontrolled catchment downstream of the Mukutmanipur dam synchronizing with high tide in river Rupnarayan.

3.2.18. Kaliaghai Sub-basin

The river Kaliaghai trickles out from Dudhkundi of Jhargram district and flows south-easterly through Paschim and Purba Medinipur to meet the other arm of Kangsabati i.e., New Cossye to form Haldi. During the course of its journey, it is fed by the flow of its tributaries namely Kapaleswari, Baghai and Chandia. The length of this river is 121 km and catchment area is 1,913 sq. km. This river is mainly responsible for flood in Sabang area of Paschim Medinipur district.

3.2.19. Rupnarayan Sub-basin

River Rupnarayan is the major drainage artery of southwestern districts of South Bengal. Being the main tributary of Hooghly River, it receives tidal discharge of Bay of Bengal throughout the year and plays an important role in draining floodwater from vast catchment area. Irrespective of discharges from its major tributaries like Mundeswari, Darakeswar, Shilabati and Kangsabati, it also receives flood water from many local drainage channels like Kata khal of Hooghly, Bakshikhal of Howrah, Chandreswar khal of Paschim Medinipur, Denan-Dehaty-Soadighi-Gangakhali-Pratapkholi-Shankrara khals of Purba Medinipur which directly outfall into Rupnarayan from its both banks. The length of this river is 80 km having local catchment area of 1,226 sq.km.

3.2.20. Haldi Sub-basin

Two rivers New Cossye and Kaliaghai join at Dheubhanga of Purba Medinipur to form river Haldi which after traversing southeastward outfalls into river Hooghly near Haldia town. It divides the Purba Medinipur district into two parts, the Northern part can be categorized as drainage area of Tamluk and the southern part can be categorized as Rasulpur-Nandigram drainage area. Except upper catchment discharges from Kaliaghai-New Cossye sub-basins, river Haldi drains out water from parts of both the above-mentioned drainage areas. The lower portion of the river Haldi is affected by over bank spills and drainage problem during the monsoon as entire stretch of 42 km of the river falls under the tidal influence of river Hooghly. The local catchment area of this sub-basin is 614 sq.km.

3.2.21. Rasulpur Sub-basin

The river Rasulpur is formed by union of two drainage channels namely Bagda and Sadarkhals. It is the main drainage channel in Contai subdivision of Purba Medinipur district. The river having length 19 km drains out floodwater of 1,556 sq. km. into the river Hooghly.

3.2.22. Pichabani-Negua Channel Sub-basin

River Pichabani and Negua Diversion channel systems are used to discharge rainwater out from Dubda basin of Purba Medinipur district. The two channels outfall into Bay of Bengal. Catchment area of this sub-basin is 808 sq.km.

3.2.23. Sundarban Drainage Sub-basin

Apart from the rivers described earlier within the Ganga basin, there is a group of rivers in Southern part of the State, which falls in the deltaic zone. These tidal rivers, estuaries and creeks are situated on the eastern side of Hooghly River popularly known as Sundarbans, which is nothing but an intricate network of number of deltaic islands of the district of South 24-Parganas. These rivers drain off whatsoever fresh discharge comes from countrysides, thus ultimately draining into Bay of Bengal. Some important rivers in Sundarban are Muriganga, Mridangabhang, Saptamukhi, Raimangal, Matla, Bidya, Thakuran, Malancha, Kalindi, Gomar etc. The total land area of Sundarban sub-basin is 6,747 sq. km. whereas including all rivers and creeks, Sundarban has gross area of 10,209 sq. km.

3.3. SUBARNAREKHA BASIN

The river Subarnarekha (also called Swarnarekha) though it has small catchment within this state, has separate entity as it directly falls into the Bay of Bengal. Originating in the Chhotonagpur Range at an elevation of 609 m. near Ranchi, it traverses through three states viz. Jharkhand, West Bengal and Orissa. It drains out rainwater from a total area of 19,684 sq. km. out of which only 3,593 sq. km falls within Purulia, Paschim Medinipur and Jhargram districts of West Bengal.

One major dam at **Chandil** and one barrage at **Galudi** have been constructed across Subarnarekha in Jharkhand. The important tributaries on the right bank of this river are Kanchi and Karkari, which meet Subarnarekha above Chandil dam and another right bank main tributary named as Kharkai meets this river near Jamshedpur upstream of Galudi barrage. Dulung is the main tributary, which joins Subarnarekha from its left in the Jhargram district of West Bengal. The total length of this river is 395 km. out of which 83 km. falls within West Bengal.

Distribution of Catchment Area of River Basins & Sub-Basins of West Bengal						
CWC Basin Code	River Basin	Sub-Basins	CATCHMENT AREA (Sq. Km.)			TOTAL (Sq. Km)
			Jharkhand	Orissa	West Bengal	
6	SUBARNAREKHA	Subarnarekha	13014	3077	3286	19377
		Kashpal			307	307
		Sub-Total	13014	3077	3593	19684

4. HYDRO-METEOROLOGICAL DATA COLLECTION & DISSEMINATION

Irrigation and Waterways Department (IWD), Govt. of West Bengal is responsible for maintenance, collection, compilation and dissemination of hydrological and meteorological data for the purpose of monitoring of flood or flood-like situation for almost all river sub-basins of the State during monsoon. For this purpose, network of river gauges and rain gauges have been established at the important locations and during monsoon flood control rooms in each district are set up including the Central Flood Control Room (CFCR) at Jalasampad Bhavan, Salt Lake, Kolkata.

4.1. Rain and River Gauges

Apart from IWD, other organizations like Central Water Commission (CWC), India Meteorological Department (IMD), State Agricultural Department (AGRI), Kolkata Port Trust (KoPT), Damodar Valley Corporation (DVC) and Surface Water Investigation Directorate (SWID) under Water Resources Investigation & Development Department (WRIDD) have set up network of river gauges and rain gauges of their own at different locations for monitoring hydrological and meteorological data. These field data mainly include daily rainfall, water level of river and reservoir, river discharge and inflow-outflow from reservoir. In addition to that other information like inflow forecast, meteorological forecast and flood damage are also collected.

Existing Hydro-Met Monitoring Stations in the State

Type	IWD	CWC	IMD	Others
Rain Gauge Stations (ORG/ARG/AWS/FCS)	103	45	65	55
River Gauge / Discharge Stations (G/G-D/HOS)	100	81	-	144
Total	203	126	65	199
ORG = Ordinary Rain Gauges	ARG = Automatic Rain Gauges			
AWS= Automatic Weather Station	FCS = Full Climatic Station			
HOS = Hydrological Observation Station (Gauge, Discharge, Silt/Sediment, Water Quality)	HMS = Hydro-Meteorological Station (Rainfall, Temperature, Wind speed, Solar radiation, Humidity, & other Weather parameters)			

Distribution of Hydro-met Stations amongst various Govt. Organisations In West Bengal

Besides Ordinary Rain & River gauges, IWD also maintains seven (7) Gauge-Discharge stations at different rivers and fourteen (14) Hydrological Observation Stations (HOS) at Dam & Barrage sites for measurement of Reservoir levels, Inflow,

Outflow, Canal discharges & sediment/silt content if requires.

Summary of Hydromet Station Data under Irrigation and Waterways Department

Type of Hydromet Stations	Total number of Station Data collected in IWD web inventory	Published in Daily Flood Reports
Number of Rain Gauges	141	84
Number of River Gauges	89	60
Number of River Gauge & Discharge	7	7
Number of Dam & Barrage Monitoring Sites (Reservoir/Pond Level, Inflow, Outflow)	20	13

A comprehensive list of existing Hydro-Met stations within the State under the jurisdiction of Irrigation & Waterways Department, Central Water Commission and India Meteorological Department and the data recorded by Irrigation & Waterways Department, is given in **Annexure-III**.

Recently under National Hydrology Project (NHP), IWD is going to commission a 'Real Time Data Acquisition System (RTDAS)' for efficient flood forecasting and inundation modelling within the State. For this, fully automated radar and sensor type hydro-met stations proposed to be installed. Following sensors are proposed:

Sensor Type	Total No. to be installed
Automatic Rain Gauge (ARG)	69
Automatic Weather Station (AWS, including ARG)	7
Automatic Water Level Recorder (AWLR)	128
Dam-Barrage Gate Sensor (GS)	13
PAN evaporimeter (PAN)	4
Automatic Flow Meter (AFM)	19
Automatic Tide Gauge (ATG)	3

The work is conceived in three phases and two are under progress and detailed lists of those stations are given in **Annexure-III**. Besides RTDAS, IWD had also proposed two canal SCADA system for Kangsabati & Mayurakshi system under NHP.

4.2. Role of Central Flood Control Room

The present flood monitoring and management system in the State comprises with the preparation of Daily Flood Report by Central Flood Control Room (CFCR) of IWD and transmission of the same to the State Disaster Management Department with the Head Quarter at Kolkata. This report is also shared with the Chief Secretary, Home Secretary of the State and other organization like Railway Authorities, Bengal Army Headquarters, CWC-Easten Zone Monitoring Office, Kolkata Port Trust (KoPT), Kolkata Municipal Corporation (KMC) and all District Magistrates of the State.

This Daily Flood Report (DFR) generally contains rainfall, river and gauge and discharge, river warning levels/ signals, weather information, reservoir level/inflow/outflow data of different Stations within and outside the State. Sometimes the location and extent of major damages, the status of affected areas under inundation etc. are also included, as and when the situation such warrants. These data are collected from different district flood control rooms under IWD (details given in **Annexure-XII**) along with other agencies like IMD, CWC and DVC by telephone, fax, e-mail or Whatsapp messages. During emergency, separate Flood Bulletin is

issued and the same will be disseminated also to the District Disaster Management Cells and other authorities via e-mail, Fax, SMS or Whatsapp messages. Daily flood reports are also uploaded in the departmental web site: www.wbiwd.gov.in.

This year, CFCR was operational 24x7 during entire monsoon & flood season starting from 1st June, 2021 to 31st October 2021, collected raw data from all existing hydro-met stations & reservoir data of IWD's district control rooms, rainfall and weather forecast/warning from IMD websites, relevant data from CWC, DVC, Chandil Dam, Galudih & Sikatia barrage authorities, compiled all these in the standard proforma and finally prepared the Daily Flood Report for dissemination by 10.00 to 10:30 a.m.

Besides the normal flood season, this year CFCR was also in force round the clock during Very Severe Cyclonic Storm '**Yaas**' right from its formation until it faded away from the State (24th to 29th May, 2021). CFCR continuously monitored the position & stages, gathered weather informations like rainfall, wind speed, strom surge etc. from IMD New Delhi & Kolkata offices, collected physical damage reports from IWD field offices and published **Special Bulletins** twice daily.

Again, for cyclonic strom '**Jawad**' CFCR became operational round the clock from 3rd to 7th December, 2021 and issued **Special Bulletins** until it faded as Low-Pressure Area and became remnant of the cyclonic storm.

5. RAINFALL

Climatological variations are observed in West Bengal due to its physical and geographical position. The annual normal rainfall of the State is 1,826 mm, of which 77% occurs during the monsoon period while the hilly regions at the foothills of Himalaya receive the heaviest rainfall ranging from 2500 mm to 4000 mm. The southern districts in the plains receive average of 1125 mm to 1875 mm. Main rainfall season in this state is the South-West monsoon season during which the entire land (excepting the extreme north, the extreme north-east and extreme south) gets 75% of the annual rainfall. The gangetic plains of West Bengal get 78% of its annual rainfall during the monsoon period distributed normally from 1st week of June to the end of September. But during last few years, some parts of West Bengal have experienced cyclone, premature heavy rainfall in the last week of May causing flood and drainage congestion. However, the late withdrawal of monsoon even after second week of October has also been observed.

5.1. Normal Rainfall Pattern

The river Ganga divides the State into two parts, which are by and large homogeneous from the meteorological point of view. The northern half is designated as 'Sub-Himalayan West Bengal' and the southern half as 'Gangetic West Bengal'. Sub-Himalayan West Bengal is more susceptible to heavy rains both in respect of amount as well as in frequency of occurrence.

Very heavy rain is more frequent in first two months (June and July) than in subsequent, in the Sub-Himalayan West Bengal. In Gangetic West Bengal, the frequency is maximum in August followed by June, July and September in that order. On the basis of rainfall distribution, the State can be divided into two broad zones -(i) The Himalayan and Sub-Himalayan Region (ii) The Gangetic Plains

i) Himalayan and Sub-Himalayan Region

The Himalayan and Sub-Himalayan Region comprises the districts of Darjeeling, Kalimpong, Jalpaiguri, Alipurduar, Coochbehar and Northern part of Islampur Sub-Division of Uttar Dinajpur district of high intensity of average annual rainfall from 2000 mm to over 4000 mm, about 80% of which is found to occur during monsoon season (Annual normal of entire districts of North Bengal = 2484 mm). On an average, Darjeeling, Coochbehar and Jalpaiguri get 114, 112 and 110 rainy days respectively in a year.

The monsoon generally follows a northern track to ultimately break up against Eastern Himalaya causing very heavy rainfall and thereafter, trough of low pressure under break monsoon conditions. It then shifts northward to the Himalayan foothills. It has been found that a precipitation between 200 to 300 mm in two hours is not unusual.

ii) Gangetic Plains

The gangetic plains which constitute the major portion of the State, can be further sub-divided into the following three sectors on the basis of average rainfall.

Sector-I: Bankura, Burdwan (Purba & Paschim), Hooghly, Nadia and Purulia districts which receive an average annual rainfall between 1140 mm and 1400 mm (Annual normal = 1348 mm).

Sector-II: Birbhum, Midnapore (Purba & Paschim including Jhargram), Murshidabad and North 24-Parganas having an average annual rainfall between 1400 mm and 1650 mm (Annual normal = 1590 mm).

Sector-III: Kolkata, Howrah and South 24-Parganas having an average annual rainfall - between 1650 mm and 1900 mm (Annual normal = 1796 mm).

Such regional variations in the precipitation may causes flood condition time to time.

5.2. Intensity & Spatial Distribution of Rainfall

As per Heavy Rain Warning Services of India Meteorological Department (IMD), Ministry of Earth Sciences, Govt. of India, Classification of Rainfall, Category of Rain Spell and Spatial distribution of daily Rainfall are as follows:

Classification of Rainfall Intensity			
Category	24 hours Rainfall over a station ending at 0830 Hrs IST (in mm)	Category	24 hours Rainfall over a station ending at 0830 Hrs IST (in mm)
Very Light Rain	Trace - 2.4	Heavy Rain	64.5 – 115.5
Light Rain	2.5 - 15.5	Very Heavy Rain	115.6 - 204.4
Moderate Rain	15.5 – 64.4	Extremely Heavy Rain	>= 204.5
Category of Rain Spell			
Category	Range of daily Rainfall of a Station (mm/hour)	Category	Range of daily Rainfall of a Station (mm/hour)
Light spell	10	Very Intense spell	31 - 50
Moderate spell	11 – 20	Extremely Intense spell	51 - 99
Intense spell	21 - 30	Cloud Brust	>= 100
Spatial Distribution of Rainfall			
Distribution	No. of Places	Description	
Isolated	One or two places	< 25% of stations get rainfall	
Scattered	At a few Places	(26–50) % of stations get rainfall	
Fairly Widespread	At many places	(51–75) % of stations get rainfall	
Wide spread	At most places	(76–100) % of stations get rainfall	
Dry	-	No station reported rainfall	
Weekly/Seasonal Rainfall Distribution on Regional Scale			
Large Excess	Percentage departure of realized rainfall from normal rainfall is + 60% or more.		
Excess	Percentage departure of realized rainfall from normal rainfall is between + 20% to + 59%.		
Normal	Percentage departure of realized rainfall from normal rainfall is between - 19 % to + 19 %.		
Deficient	Percentage departure of realized rainfall from normal rainfall is between - 20 % to - 59 %.		
Scanty	Percentage departure of realized rainfall from normal rainfall is between - 60 % to - 99 %.		
No Rain	Percentage departure of realized rainfall from normal rainfall is - 100 %.		
Rainfall Distribution on All India Scale			
Normal	Percentage departure of realized rainfall from normal rainfall is within $\pm 10\%$ of the Long Period Average.		
Below Normal	Percentage departure of realized rainfall from normal rainfall is < 10 % of the Long Period Average.		
Above Normal	Percentage departure of realized rainfall from normal rainfall is > 10 % of the Long Period Average.		
All India Drought Year	When the rainfall deficiency is more than 10%, and when 20 to 40% of the country is under drought conditions, then the year is termed as All India Drought Year		
All India Severe Drought Year	When the rainfall deficiency is more than 10% and when the spatial coverage of drought is more than 40%, it is called as All India Severe Drought Year.		

5.3. Monsoon 2021

As per IMD-Delhi, this year South West Monsoon had onset over Kerala on 3rd June and had arrived some part of West Bengal & Sikkim on 10th June and covered whole of West Bengal within 12th June.

The Sectoral variations of monthly average rainfall in West Bengal during monsoon months 2021 is given below with colour coding, which is derived from IMD's district-wise monthly rainfall data (presented in **Annexure IV-A**).

Variation of Monthly Average Rainfall (mm) of Sub-Himalayan West Bengal during Monsoon 2021

Month	June			July			August			September

**Raw Data Source: IMD, Kolkata

The graphical representation of district-wise monthly rainfall 2021 vis-à-vis normal rainfall are given in **Annexure IV-B**. The cumulative monthly rainfall of various Rain gauge stations for different River Sub-Basins, as observed at IWD's Central Flood Control Room during entire flood season i.e., from 1st June to 31st October, is given in **Annexure V-B**.

The progress of monsoon 2021 week by week, as per IMD-New Delhi for two meteorological sub-divisions in West Bengal, is presented below.

S.NO	MET. SUBDIVISION	WEEK ENDINGS																
		3-Jun	10-Jun	17-Jun	24-Jun	1-Jul	8-Jul	15-Jul	22-Jul	29-Jul	5-Aug	12-Aug	19-Aug	26-Aug	2-Sep	9-Sep	16-Sep	23-Sep
5	S.H.W.B. & SIKKIM	Green	Green	Red	Blue	Green	Red	Green	Yellow	Green	Blue	Red	Blue	Green	Red	Green	Red	Yellow
6	GANGATIC W.B.	Blue	Green	Blue	Red	Green	Red	Green	Green	Yellow	Blue	Red	Green	Blue	Red	Blue	Red	Blue

In North Bengal districts, the average monsoon rainfall deviation was -14% from its normal average i.e. NORMAL while that of South Bengal districts was 29% i.e. EXCESS.

Average Monsoon [01.06.21-30.09.21] Rainfall (mm)			
Zone	Actual	Normal	% Dep
North Bengal	1672.3	1945.5	-14.0%
South Bengal	1509.7	1170.9	28.9%
West Bengal	1613.0	1405.0	14.8%

For the State as a whole, the **monsoon rainfall** as per IMD, from 1st June to 30th September 2021 was **normal** with the percentage departure (i.e., deviation from its normal value) was **14.8%**. The annual rainfall of the State was EXCESS a little with percentage departure **20.6%** due to pre-monsoon excess and post monsoon large excess rainfall. Season-wise Average Rainfall Statistics of West Bengal for the Year 2021 as per data provided by IMD, Kolkata is presented in **Annexure V-A**.

As per IMD-Delhi, the process of South-west monsoon withdrawn from West Bengal started on 11th October and finally withdrawn on 22nd October 2021. The withdrawal map is given below.

5.4. Rainfall Observed at CFCR

The DFR of CFCR, IWD contains 84 raingauge stations, which captures daily rainfall data from 1st June to 31st October. The Rainfall Data Statistics out of 12,852 data is presented below:

5.5. Annual Rainfall 2021

As defined by IMD, meteorological seasons comprising of four seasons. They are: Winter (1st January to 28th February), Pre-monsoon (1st March to 31st May), Monsoon (1st June to 30th September) and Post-monsoon (1st October to 31st December) seasons. The seasonal distribution of total annual rainfall of the State is presented below:

A district-wise visual comparison of last five years (2017-2021) average monsoon rainfall is presented in **Annexure VI**. Large multiple peaks are observed for the year 2021.

IMD, RMC, Kolkata has prepared a percentage rainfall departure map from long period average for the districts in West Bengal for winter, pre-monsoon, monsoon, and post monsoon period which are presented below:

**Rainfall % Departures from the Long Period Averages
for Districts in WEST BENGAL**

PERIOD : 01.01.2021 - 28.02.2021

LEGEND: L. EXCESS (+60% OR MORE) EXCESS (+20% TO +59%) NORMAL (+19% TO -19%)
 DEFICIENT (-20% TO -59%) L. DEFICIENT (-60% TO -99%) NO RAIN (-100%) NO DATA

**Rainfall % Departures from the Long Period Averages
for Districts in WEST BENGAL**

PERIOD : 01.03.2021 - 31.05.2021

LEGEND: L. EXCESS (+60% OR MORE) EXCESS (+20% TO +59%) NORMAL (+19% TO -19%)
 DEFICIENT (-20% TO -59%) L. DEFICIENT (-60% TO -99%) NO RAIN (-100%) NO DATA

**Rainfall % Departures from the Long Period Averages
for Districts in WEST BENGAL**

PERIOD : 01.06.2021 - 30.09.2021

LEGEND: L. EXCESS (+60% OR MORE) EXCESS (+20% TO +59%) NORMAL (+19% TO -19%)
 DEFICIENT (-20% TO -59%) L. DEFICIENT (-60% TO -99%) NO RAIN (-100%) NO DATA

**Rainfall % Departures from the Long Period Averages
for Districts in WEST BENGAL**

PERIOD : 01.10.2021 - 31.12.2021

LEGEND: L. EXCESS (+60% OR MORE) EXCESS (+20% TO +59%) NORMAL (+19% TO -19%)
 DEFICIENT (-20% TO -59%) L. DEFICIENT (-60% TO -99%) NO RAIN (-100%) NO DATA

6. FLOOD SEASON 2021

As per Govt. of India's Water Resources Information System (India-WRIS) and Central Water Commission (CWC), monsoon period comprises of five months from June to October. Accordingly, flood season in West Bengal also covers from June to October. The distribution of monthly average rainfall in the State for this season shows excess rainfall with average departure of 25.5% that varies from maximum surplus of 61.9% in October 2021 to maximum deficit of only -0.6% in August 2021.

Distribution of Monthly Average Rainfall in West Bengal during Flood Season 2021

Month	Actual Rainfall (mm)	Normal Rainfall (mm)	% Departure	Remarks
June-21	394.3	316.7	24.5%	Excess rainfall
July-21	435.8	419.8	3.8%	Normal rainfall
Aug.-21	358.7	361.0	-0.6%	Normal rainfall
Sept.-21	424.2	307.5	38.0%	Excess rainfall
Oct.-21	214.2	132.3	61.9%	Large excess rainfall

* Data source: IMD-Kolkata

Month-wise statistical analysis of River Gauges i.e. Maximum peak values, Minimum river gauges, average river stages, number of days river level crossed primary danger level (PDL), danger level (DL) and extreme danger level (EDL) and during Flood Season, 2021 is presented in **Annexure-VII**.

6.1. Flood Spells in North Bengal

6.1.1. In June 2021: After the onset of monsoon, significant rainfall had occurred at few places of North Bengal on 30th June with extremely heavy rainfall at Hasimara, Banarhat & Malbazar. Monthly average rainfall was closed to normal, only -6.4% deviation. As the rivers were normally thirsty after summer, it was well attenuated and river stages has just crossed primery danger levels only.

6.1.2. In July 2021: With few discrete rainfalls throughout the month, one day maximum rainfall had occurred on 17th of July at Coochbehar District. Monthly average rainfall was deficient with -28.5% deviation. Thus, the river stages were well under control except River Jalduka at NH-31 crossing where it had crossed just primery danger level.

6.1.3. In August 2021: Average rainfall of August in North Bengal was excess i.e., above normal with 4-5 days rainfall spells occurred thrice. Hence, river stages raised and River Torsa at Hasimara and River Jalduka at NH-31croosring were very close to corresponding dander levels. River Fulahar at Teljana and River Ganga-Padma at Manikchakghat ruled very high. They crossed extreme danger levels and remained in high spate on most of the month.

6.1.4. In September 2021: On the contrary, rainfall in North Bengal districts in September were largely deficient except one day heavy rainfall occurred on 2nd September over Jalpaiguri, Alipurduar and Coochbehar districts. As a result, Torsa, Jalduka and Mansai river showed some higher stages on 3rd September.

6.1.5. In October 2021: Rainfall of October in North Bengal was huge on 20th due to low pressure formation over Bay of Bengal and its movement around the region. Extremely heavy rainfalls occurred at Darjeeling, Siliguri, Jalpaiguri and heavy to very heavy rainfall at most of the places of North Bengal. Hence river stages of Teesta were abnormally high with imposition of 'Red' warning signals. Torsa, jaldhaka and other rivers were ruled high. Later, after the withdrawal of monsoon all became normal.

All monthly rainfall variations are stated in cl. 5.3 of previous chapter and also presented in **Annexure IV- A & B**. Flood frequency curves (Gauge Level vs. Time) of different rivers in entire North Bengal have been presented in **Annexure VIII-A**. Due to

high river stages, warning signals were frequently imposed for unprotected & protected areas of North Bengal. List of such signals is presented in **Annexure-X**.

6.2. Flood Spells in South Bengal

6.2.1. In June 2021: A good amount of rainfall received in this month Average rainfall of June in South Bengal was also excess i.e., above normal with 2-3 days rainfall spell occurred between 16th to 18th. River Dwarakeswar and Channels within Lower Damodar region viz. Hurrura, Amta, Short Cut where on high stages due to cumulative upland discharges.

6.2.2. In July 2021: Huge rainfall also received in this month. Average rainfall of July in South Bengal was excess i.e., above normal with 3-4 days rainfall spell occurred at the end of month. Extremely heavy rainfall occurred at Kangsabati-Silabati catchments; Heavy to very heavy rainfall occurred at Ajoy, Dwarakeswar, Lower Damodar and Haldi catchments. As a consequence, most of the rivers were on very high stages due to incessant rainfall and cumulative upland discharges. Several damages had occurred as a result of erosion, subsidence and failure of flood embankments.

6.2.3. In August 2021: On the contrary, rainfall in South Bengal districts in September were normal with -15.5% deficiency. Scattered rainfall received though out the month, mostly at beginning. Due to exceptional rainfall at July end, South Western flashy rivers were at high stages at the beginning along with Ganga-Padma, Bhagirathi-Hughli system which on an average on high stage due to upper catchment run-off.

6.2.4. In September 2021: Average Rainfall in September was in Large Excess for South Bengal with 69.2% extra, due to back-to-back low-pressure formation and presence of deep depressions. 2-3 days huge rainspells thrice in this month made devastation in Kangsabati-Silabati, Kaliaghari-Kapaleswari, Haldi, Chandia, Rasulpur and Lower Damodar-Roopnarayan sub-catchments. Most of the rivers run above extreme danger levels and as result several damages had occurred.

6.2.5. In October 2021: Average Rainfall in October was reduced compared to previous month though in Excess in 38% than normal. Widespread rainfall upto withdrawn of Monsoon seen with a low-pressure effect. As a result of September end's heavy downpour, river stages of most of the rivers of South Bengal were fatty at beginning, later subsided with dry days.

Statistical analysis of River gauge data for whole West Bengal during the flood season 2021 is detailed in **Annexure-VII**. Flood frequency curves of different rivers in South Bengal have been presented in **Annexure VIII-B**.

6.3. Reservoir and Barrage Data

The instantaneous Inflow-Outflow and Reservoir level of large dams and important barrages either under the control of Irrigation & Waterways Department or those have direct impact on the flood situation of West Bengal have been measured during the flood season. Monthly Statistics of data of those Dam-Barrage Operations i.e. maximum, minimum & average reservoir level, inflow & outflow data was analyzed and presented in **Annexure IX-A**. The inflow-outflow data along-with reservoir levels of those important Dams and Barrages during 1st June to 31st October, 2021 have been graphically presented in **Annexure IX-B**.

6.4. Warning / Signal System

North Bengal Central Flood Control Room, Jalpaiguri imposes warning / signal system for protected and unprotected river banks of North Bengal during peak flood period. The details of signal imposed and later withdrawn; on receding of river levels in given in the following table.

Flood Warning Levels of North Bengal Rivers

Gauge obtained from	Signal Imposed By	Name of River	Name of Gauge Station	Unprotected Area		Protected Area

Abbreviations: - JPG: Jalpaiguri, CBR: Coochbehar, APD: Alipurduar, SLG: Siliguri

The warning signals imposed for different rivers in North Bengal for this flood season is tabulated in **Annexure-X**.

6.5. Flood Damage Data

As spelt earlier, this year flood damages were huge. Extent and expenditure involved for restoration of flood damages occurred in different districts of West Bengal have been presented in **Annexure XI-A**. Typical pictures of damages and restoration measures taken in 2021 are presented below:

Bagedantola restoration works at P.S. Bhutni, Block – Manikchak, Malda

Kesarpur restoration works at P.S. Bhutni, Block – Manikchak, Malda

Damages of Ganga Left Bank

6.6. Cyclonic Storms in 2021**6.6.1. Very Severe Cyclonic Storm “YAAS” over Bay of Bengal (23rd–29th May, 2021)**

A low-pressure area (LPA) formed over eastcentral Bay of Bengal (BoB) in the morning of 22nd May. It lay as a well marked LPA in the same afternoon over eastcentral BoB. Under favourable environmental conditions, it concentrated into a depression over eastcentral BoB in the noon of 23rd May, 2021. It moved northwestwards and intensified into a deep depression (DD) over eastcentral BoB in the midnight of 23rd May and into the Cyclonic Storm (CS) –YAAS, in the early morning of 24th over the same region.

It moved nearly north-northwestwards and intensified into a Severe Cyclonic Storm (SCS) in the midnight of 24th May over eastcentral BoB. It started moving northwards from the morning of 25th and intensified into a Very Severe Cyclonic Storm (VSCS) in the evening over northwest BoB. Thereafter, it moved north-northwestwards reached peak intensity of 75 knots (kts) and lay centred over northwest BoB about 30 km east of Dhamra Port, Odisha during early morning of 26th May. Continuing to move north-northwestwards, it crossed north Odisha coast near latitude 21.35°N and longitude 86.95°E, about 20 km to the south of Balasore as a VSCS with maximum sustained wind speed of 75 kts gusting to 85 kts (130 -140 kmph gusting to 155 kmph) between 10:30-11:30 IST of 26th.

Further moving north-northwestwards, it weakened rapidly into a SCS over north coastal Odisha in the afternoon, into a CS over north Odisha in the evening and into a DD in the midnight of 26th over north interior Odisha and adjoining Jharkhand. It weakened into a depression over central parts of Jharkhand in the noon of 27th. Thereafter, it moved northwestwards and weakened into a well-marked LPA over Bihar and adjoining southeast Uttar Pradesh in the early morning of 28th May. It became an LPA over southeast UP and adjoining Bihar on 28th evening and became less marked on 29th morning.

Typical INSAT 3D satellite and radar imagery from Doppler Weather Radar at Paradip as monitored by IMD are presented below.

The IMD forecasted and observed track of Yaas is also presented below:

IMD's Observed track and forecast track of Yaas

Gale wind speed reaching 130-140 gusting to 155 kmph prevailed along and off Balasore, Bhadrak districts of north coastal Odisha and 100-120 gusting to 130 kmph prevailed along and off coastal districts of West Bengal (Purba Medinipur and South 24 Parganas district) during the time of landfall. Estimated storm surge of about 2-4 meters height above astronomical tide inundated low lying areas of Balasore and Bhadrak districts of north coastal Odisha and coastal West Bengal districts (Purba Medinipur and 24 Pargana districts) during the time of landfall.

As per IMD's report on Yaas (June, 2021), no death was reported in West Bengal. The state has incurred a total loss of more than Rs 20,000 crore due to Cyclone, Yaas which battered the state and around 2.21 lakh hectare of crops were damaged. 3 lakh houses were damaged in West Bengal; while around 1 crore people were affected in the state. The cumulative list of Damages to the flood management infrastructure of I&WD due to the Very Severe Cyclonic Storm "YAAS"on 26th May 2021 (realized and updated upto 28th May 2021) is provided in **Annexure XI-B**.

Rescue from flood in West Bengal

Devastated homes in West Bengal

Damaged shoreline at a beach in Shankarpur

Flooding in coastal Digha-Shankarpur area

Few representative pictures of I&WD's Infrastructure damaged in YAAS and restoration measures taken thereafter are presented below side by side:

Embankments damaged in 'YAAS'

Mouza Banashyamnager, River Pakhirala, South 24 Parganas

Restoration works done

Mouza-Sapkali, River Hooghly, South 24 Parganas

Kalibazar embankment at Panskura, Purba Medinipur

Left Bank of River Dansa, Mouza-Kumirmari, GP. Khulna, South 24 Parganas

AILA Embankment, Mouza-Atapur, GP. Monipur, River Baro Kalagachi, North 24 Parganas

7. CONCLUSION

Our State is a huge recipient of run-off generated from outside of the State. It has typical basin characteristics. In the northern Sub-Himalayan region, the rainfall is high and the terrain slope is steep. The rivers in the Terai region are wide, shallow and mostly braided. Due to mindless denudation of forest cover and unstable geology in the hills, the silt loads are continuously deposited in the river beds, reducing the carrying capacity of rivers. It causes overflow during high discharges, often creating flood situations. In the northern foothills, central and southern region, heavy rainfall and surface run-off descending from the upper catchments, often outside the State boundary, causes flood inundation and drainage congestion due to flat topography of the region.

Main structural measures of flood control in West Bengal are river embankments measuring about 10,500 km., spread over different river systems, constructed over the years. There are major dams across river Kangsabati, Mayurakshi and Damodar River systems. In the Damodar system, moderation of the dam release during the peak flood is possible to some extent.

In North Bengal, an elaborate flood warning system is maintained by the department that warns the common people about the trend of rise of water level in rivers and thus alarms them to take necessary precautionary measures well beforehand. In Central and South Bengal, the water level of different rivers together with their danger and extreme danger levels and the releases from different dams and barrages are intimated to different authorities' time to time during the entire flood season.

Besides this, our department continuously maintains close liaison with the Regional Meteorological Centre (RMC), Kolkata and keeps continuous track of India Meteorological Department (IMD) website in order to collect dynamic information on weather condition during entire monsoon period. In critical situations, the department adopts appropriate measures commensurate with the circumstances. Central Water Commission (CWC) always extend their co-operation by providing different hydro-meteorological data under their jurisdiction.

In every monsoon and during cyclonic storm emergencies beyond the normal flood season, Central Flood Control Room (CFCR), with toll-free landline facilities, becomes operational at Jalasampad Bhawan, Salt Lake, Kolkata to keep close vigil of the situations. It functions round the clock and is always on high alert. It collects daily hydro-meteorological and climatological data from all possible sources, prepares Daily Flood Reports and Bulletins and disseminates the same to all concerned. Daily reports during entire monsoon period are also available in public domain in the departmental website www.wbiwd.gov.in. Like previous year, this year two regional flood control rooms (RFCR) at North Bengal, one at Club Road, Jalpaiguri and another at Green Park, Malda were also functional for communication of information in a better way.

Besides the normal monsoon period, this year CFCR was also forced to be pre-opened and re-opened during extreme exigencies of the severe cyclonic storms 'Yaas' and 'Jawad' that had struck on 26th May, 2021 and 5th December, 2021 respectively. CFCR had continuously monitored and kept track of the development and advancement of the storm, collected data of associated rainfall, wind speed, storm surge and damages of departmental infrastructure and published special bulletins twice daily during these exigencies.

In the previous year, overall rainfall has been above normal in South Bengal with frequent incessant spells leading to several breaches, damages to IWD infrastructure creating flood situation at some places. Apart from that, damages in river and sea embankments of coastal districts have occurred due to very severe cyclone 'Yaas'. For all situations, department has taken appropriate action in proper time for complete restoration of the damages.

Annexure VI: Graphical comparison of last five years average rainfall of different districts

Annexure VI: Graphical comparison of last five years average rainfall of different districts**Daily Rainfall Average (mm) of Jalpaiguri District for Last 5-years (2017-2021)**

(Average Daily Rainfall of Rain Gauge Stations at Malbazar, Jalpaiguri, Banarhat, Mainaguri & Hasimara)

**Daily Rainfall Average of Darjeeling District for Last 5-years (2017-2021)**

(Average Daily Rainfall of Rain Gauge Stations at Darjeeling & Siliguri)

Annexure VI: Graphical comparison of last five years average rainfall of different districts

Daily Rainfall Average (mm) of Uttar Dinajpur District for Last 5-years (2017-2021)
(Average Daily Rainfall of Rain Gauge Stations at Islampur & Raiganj)

Daily Rainfall Average (mm) of Dakshin Dinajpur District for Last 5-years (2017-2021)
(Average Daily Rainfall of Rain Gauge Stations at Balurghat & Gangarampur)

Annexure VI: Graphical comparison of last five years average rainfall of different districts**Daily Rainfall Average (mm) of Malda District for Last 5-years (2017-2021)***(Daily Rainfall of Rain Gauge Station at Englishbazar)***Daily Rainfall Average (mm) of Murshidabad District for Last 5-years (2017-2021)***(Average Daily Rainfall of Rain Gauge Stations at Berhampore & Kandi)*

Annexure VI: Graphical comparison of last five years average rainfall of different districts**Daily Rainfall Average (mm) of Birbhum District for Last 5-years (2017-2021)**

(Average Daily Rainfall of Rain Gauge Stations at Paikor, Md. Bazar, Rampurhat, Mallarpur, Deocha, Tilpara Barrage, Shyambati, Hinglow & Debogram)

**Daily Rainfall Average (mm) of Bankura District for Last 5-years (2017-2021)**

(Average Daily Rainfall of Rain Gauge Stations at Sonamukhi, Bankura, Indus & Mukutmanipur)

Annexure VI: Graphical comparison of last five years average rainfall of different districts**Daily Rainfall Average (mm) of Purulia District for Last 5-years (2017-2021)**

(Average Daily Rainfall of Rain Gauge Stations at Simulia, Purihansa, Tusuma, Kharidwar & Phulberia)

**Daily Rainfall Average (mm) of Jhargram District for Last 5-years (2017-2021)**

(Daily Rainfall of Rain Gauge Station at Jhargram)

Annexure VI: Graphical comparison of last five years average rainfall of different districts**Daily Rainfall Average (mm) of West Midnapore District for Last 5-years (2017-2021)**
(Average Daily Rainfall of Rain Gauge Stations at Amlagora, Ghatal, Midnapore, Sabang & Barisha)**Daily Rainfall Average (mm) of East Midnapore District for Last 5-years (2017-2021)**
(Average Daily Rainfall of Rain Gauge Stations at Panskura, Tamluk, Amgachia, Itamogra, Contai & Digha)

Annexure VI: Graphical comparison of last five years average rainfall of different districts**Daily Rainfall Average (mm) of Paschim Bardhaman District for Last 5-years (2017-2021)**

(Average Daily Rainfall of Rain Gauge Stations at Satkahania, Guskara, Asansol & Durgapur)

**Daily Rainfall Average (mm) of Purba Bardhaman District for Last 5-years (2017-2021)**

(Average Daily Rainfall of Rain Gauge Stations at Katwa, Jamalpur, Kanainatsal, Memari, Seharabazar & Lohai (Raina))

Annexure VI: Graphical comparison of last five years average rainfall of different districts

Daily Rainfall Average (mm) of Hooghly District for Last 5-years (2017-2021)
(Average Daily Rainfall of Rain Gauge Stations at Arambag, Singur, Champadanga & Tarakeswar)

Daily Rainfall Average (mm) of Howrah District for Last 5-years (2017-2021)
(Average Daily Rainfall of Rain Gauge Stations at Domjur & Amta)

Annexure VI: Graphical comparison of last five years average rainfall of different districts

Daily Rainfall Average (mm) of Kolkata District for Last 5-years (2017-2021)
(Daily Rainfall of Rain Gauge Station at Alipore)

Daily Rainfall Average (mm) of North 24 Parganas District for Last 5-years (2017-2021)
(Average Daily Rainfall of Rain Gauge Stations at Bangaon, Tentulia & Dumdum)

Annexure VI: Graphical comparison of last five years average rainfall of different districts

Daily Rainfall Average (mm) of South 24 Parganas District for Last 5-years (2017-2021)
(Average Daily Rainfall of Rain Gauge Stations at Chowbaga, Uttarbhag & Sagar Island)
