Annexure I	: River System Details	33
Annexure II	: Index Map of River Basins	38
Annexure III	: Existing Hydro-met Stations	39
Annexure IV-A	: District-wise Monthly Rainfall Statistics	51
Annexure IV-B	: District-wise Monthly Rainfall Graphs	54
Annexure V-A	: Season-wise Average Rainfall Statistics	64
Annexure V-B	: Station-wise Monthly Monsoon Rainfall	65
Annexure VI	: Comparison of last six years Rainfall	67
Annexure VII	: Monthly Statistics of River Gauges	78
Annexure VIII-A	: Flood levels of North Bengal Rivers	80
Annexure VIII-B	: Flood levels of South Bengal Rivers	91
Annexure IX-A	: Monsoon Dam-Barrage Statistics	112
Annexure IX-B	: Monsoon Dam-Barrage Graphs	113
Annexure X	: List of Signal Imposed	120
Annexure XI	: Flood Damage Report during 2022	122
Annexure XII	: Flood Control Rooms under I.&W. Dept.	186

PREFACE

West Bengal being the lowermost riparian state of Ganga Basin and situated at the foothills of several Himalayan rivers of Brahmaputra Basin, the problem of flood management and drainage is quite acute here. Most of the rivers in the State originate from outside the State boundary and thus they are either of inter State or International category. The State has often witnessed destructive flood, even without any substantial rainfall within the geographical limits of its own. Along-with flood and water logging, various allied problems like bank erosion, embankment breach, drainage congestion and cyclonic storm has often accentuated the flood disaster. The coastal areas along the Sundarban delta, which happens to be the largest delta of the world, often experience high tidal surges resulting in severe erosion and inundation to the country sides. In a nutshell, West Bengal has about 42.5% of its geographical area as flood prone, happens to be one of the prime flood affected States in the country.

The flood and water related disasters and associated problems in West Bengal has become almost an annual feature. Many parts of the State get onslaught of flood water almost every year resulting in severe loss to standing crops, cattle and properties. Statistically, this flood fury has increased during the last two decades.

To protect the country-side from flood ingress during peak monsoon and high tide, flood embankments are constructed along the vulnerable river banks. Those embankments constructed in various districts of the State in general and in the deltaic Sundarbans in particular, are used as prime communication links, particularly during the period of natural calamity for safe passage of people and relief materials. It virtually serves as vital lifeline to the affected areas during adverse situation. Disruption of such communication links by way of subsidence and sudden breach during flood creates disaster. Daily life in the affected areas get jeopardized as the areas become devoid of basic amenities of life.

Factors such as intensity and duration of rainfall, sedimentation of river bed, imprudent reservoir control, tidal lockage, obstruction and encroachment in natural waterways play vital role in the occurrence of flood. Basin-wise study of flood factors and evaluation of flood hazards are indispensable for chalking out future effective plans for flood control and management measures. Accordingly, Irrigation & Waterways Directorate at the end of every flood season ritually brings out an Annual Flood Report incorporating the history of rainfall patterns of the monsoon season, district rainfall records, and major river gauge levels across the State, reservoir inflow-outflow and major flood events of the year.

Throughout the year, overall average rainfall of the State is 15.1% below normal. The rainfall in the north is 6.2% less than normal while in the south, it is 23% below normal i.e. deficient. Significant incessant rainfall in frequent spells observed in the month of June for North Bengal while in August for South Bengal made few rivers to flow in high stages and as a consequence some damages had occurred. Few damages had also occurred at vulnerable spots of the coastal earthen embankments due to effect of Bhora Kotal synchronized with rain and easterly wind. However, the restoration works were well undertaken by the Department during the year 2022.

RIVER NETWORK IN WEST BENGAL

1. INTRODUCTION

Geographically, the State of West Bengal is capped by the Himalayan snow-peaks in the North and frothy sea of Bay of Bengal on the South. The terrain is a combination of land varying from hilly regions in the north and partly high plateau in the south-west to the Gangetic alluvial plains in the rest areas. The State is beset with extensive network of rivers, their tributaries, rivulets, jhoras, irrigation canals, wetlands, ponds, beels and low-lying pockets of water bodies. With the Tropic of Cancer passing across it, the State is situated in between $21^{\circ}31'$ & $27^{\circ}13'14''$ North Latitudes and $85^{\circ}45'20''$ & $89^{\circ}53'$ East Longitudes.

Salient features of West Bengal are given below in seriatim to give an outline of the flood situation of the State.

Salient Features:

Geographical area of State	:	88,752 sq. km.
Population (as per last census, 2011)	:	9.13 crores
No. of Districts	:	23
Total no. of blocks	:	341
No. of flood susceptible districts	:	19
No. of Vulnerable blocks	:	198 (in Flood & Tidal inundation)
River basins (with CWC code)	:	Ganga (2A), Brahmaputra (2B), and Subarnarekha (6).
Number of River Sub-basins	:	39
Total Catchment area	:	1,80,628 sq. km.
Catchment area outside of the State	:	91,876 sq. km. (outside of West Bengal but within India: 57624 sq.km. & outside of country: 34,252 sq.km.)
Annual average rainfall	:	1,826 mm (Northern part: 2750 mm, Alluvial & Deltaic plain: 1650 mm, Western plateau: 1450 mm)
Total flood prone area	:	37,760 sq. km.
Area already protected	:	35,380 sq. km.
Length of Embankment	:	10,584 km.
Length of Drainage Channel	:	8,409 km.
Length of erosion protection work other than embankments	:	2,389 km.
Length of sea wall	:	67 km.
Total number of Outfall sluices	:	2,781
Number of Pumping stations	:	20
Surface water potential	:	136.9 BCM
Ground water potential	:	23.6 BCM

2. RIVER SYSTEMS AND FLOOD PROBLEMS

West Bengal, a part of Bengal Delta, has a long-recorded history of flood. At present 42.5% of total area of the State is susceptible to flood. Reason is the landmass of the State was formed by the Ganga-Padma system of rivers through the delta building process of which flood being the main carrier of sediments, the bulk of fluvial deposit, in huge volumes. The highest affected area as recorded in 1978 is about 30,607 sq. km and in 2000, it is about 23,971 sq. km.

Most of the rivers in the State are either Inter-State or International in character. The flood problems of the State are of different nature at different regions which are described below.

2.1. In North Bengal:

In North Bengal, rivers viz. **Teesta, Torsa, Jaldhaka, Raidak** and **Sankosh** after originating in the neighboring countries of Bhutan and Tibet and the State of Sikkim, flow downwards through the districts of Darjeeling, Kalimpong, Jalpaiguri, Alipurduar and Coochbehar to meet the River Brahmaputra at different locations in Bangladesh, another neighbouring country. The combined catchment of all this system of rivers up to the international border is 37,545 sq. km.

The rivers of the districts of Uttar Dinajpur and Dakshin Dinajpur namely, **Dauk, Nagor, Kulik, Tangon** and **Punarbhava** after originating at Bangladesh pass through these districts and either directly or indirectly contribute catchment discharges into the River Ganga-Padma in Bangladesh after the Farakka Barrage. River **Atreyee**'s major upstream inflow from Bangladesh, runs across Dakshin Dinajpur and outfalls into River Brahmaputra in Bangladesh again. The combined catchment area of the river system up to the international border is 8,873 sq. km.

The southern part of district Malda through which the River **Ganga** flows receives its flood water from about 11 States and is battered by the run-off flow generated from these vast areas. Ultimately the river flows down the Farakka Barrage to Bangladesh. The western side of the Malda district receives floodwater mostly from neighboring country of Nepal and State of Bihar through a network of rivers called **Mahananda** and **Fulahar**. Fulahar, after flowing straight south, joins with Ganga upstream of Farakka barrage while Mahananda turns towards south-east and after bifurcating Malda, outfalls into River Ganga-Padma at downstream of Farakka Barrage in Bangladesh. The combined catchment of Mahananda-Fulahar system is 19,342 sq. km.

Major contributing factors to flood in North Bengal regions are the run-off because of heavy local rainfall, discharge of upper basin areas and also outfall condition in the neighboring countries. The Mahananda and most of the rivers of Uttar and Dakshin Dinajpur districts get stagnated when the Ganga upstream and downstream of Farakka Barrage rules high thereby not allowing drainage of flood discharge during that period.

2.2. In South Bengal:

There are certain distinctive features of drainage condition which give rise to flood situation in south Bengal. The flood in this zone becomes voluminous because of the shape of the catchment area, its steep slope starting from a high-level plateau area and sloping sharply down to a flat terrain near the

outfall of limited capacity. This feature is again adversely affected by tidal conditions as is generally noticed in the month of September, the likely month of occurrence of flood.

Basin-wise there are quite a number of river systems on the right bank of the river Bhagirathi-Hooghly like **Pagla-Bansloi, Dwarka-Brahmani, Mayurakshi-Babla** and **Ajoy**. These rivers together drain out flood water from an area of 18,177 sq. km, spread over the State of Jharkhand (the Chotanagpur Plateau) and the districts of Birbhum, western part of Murshidabad, Purba & Paschim Bardhaman, and finally outfall into river **Bhagirathi**. Carrying capacity of the river Bhagirathi is only 25% of the combined peak flood discharges generated from these basins because of simultaneous heavy rainfall, as it occurred during the flood of September 2000. In this vast tract of land there is one major reservoir, that is, Massanjore Dam over river **Mayurakshi** which interferes the flood discharge of only 11% of aforesaid combined catchments.

On the left bank of the Bhagirathi River system the **Bhairab-Jalangi-Sealmari** group of rivers originate from Ganga-Padma at Akherigunj in Murshidabad district and meet the Bhagirathi at Swarupgunj in Nadia District. This system of rivers between them drains a total area of 2,537 sq. km. of Murshidabad and Nadia districts. Generally, this area suffers from flood because of three reasons – (i) high intensity rainfall in the basin area itself (ii) inflow of flood water from Ganga-Padma at its high spate and (iii) drainage congestion at its outfall because of high stage of river Bhagirathi during high tide.

In the **Damodar-Barakar** River system, the rivers originate at Chhotanagpur plateau of Jharkhand and flows down the plains of West Bengal to outfall into the **Rupnarayan-Hooghly** system through two channels namely **Mundeswari** and **Amra Channel**. The catchment area upto **Durgapur Barrage** is 18,026 sq. km. as against total catchment of 24,341 sq. km. In this catchment area there are only 4 (four) reservoirs having a storage capacity of 1.21 BCM. The original concept of flood storage was to have an area reserved for storing a volume of 3.58 BCM. Thus, with this limited flood storage capacity the storage dams at present can modify only the peak flood discharge. Any discharge above 70,000 cusecs downstream of Durgapur barrage may cause flood depending on the outfall condition of the Mundeswari at Harinkhola.

The **Shilabati-Darakeswar** and **Kangsabati-Kaliaghai** river systems which have combined catchment areas of 16,938 sq. km spread out in the districts of Purulia, Bankura, Jhargram, Paschim and Purba Medinipur outfall into river **Rupnarayan** and **Haldi** respectively which finally meet river Hooghly. The **Kangsabati-Kumari dam** at Mukutmanipur, Bankura intercepts flood discharge of only 22% of the aforesaid combined catchment area. In this basin spillway discharge from Kangsabati dam above 50,000 cusecs may cause flood at lower reaches downstream of **Mohanpur Anicut** near Midnapore Town depending on tidal condition of the outfall and rainfall in the uncontrolled catchment downstream of Kangsabati dam.

The **Mathabhang-Churni-Ichamati** system of rivers originate at the Mathabhang off-taking from Ganga-Padma downstream of Farakka Barrage in Bangladesh and on reaching West Bengal at Majdia in Nadia district, bifurcates in two branches (i) the Churni flowing on South-Westerly direction meeting the Bhagirathi at Ranaghat and (ii) the other branch namely, the Ichamati flowing on South-Easterly direction to meet Bay of Bengal through the

creek of Raimangal. The main flood situation in this area arises because of inflow from Ganga-Padma (when it rules high), rainfall in the own catchment area and also tide lockage. In 2000 flood, a very unusual situation arose where the Bhagirathi transferred a large volume of its floodwater to this basin area by breaching its embankments at several places.

Index map of river system in North Bengal and South Bengal is presented below. The inventories of rivers, tributaries, branch channels within the sub basins have been presented in **Annexure-I**.

2.3. Historical record of flood:

Historical record of flood available in West Bengal from 1960 till present year i.e. 2022 is given below:

HISTORICAL RECORD OF FLOOD IN WEST BENGAL		
Flood affected Area (in Sq. Km.)	Years during which Flood occurred (1960 to 2022)	Total Number of Years
Below 500	1985, 1989, 1992, 1994, 1997, 2001, 2002, 2005, 2006, 2010, 2012, 2013, 2014, 2016, 2018, 2019 & 2022	17
Between 500 – 2,000	1962, 1963, 1964, 1965, 1966, 1972, 1975, 1996, 2003, 2004, 2011, 2015 & 2020	13
2,000 – 5,000	1960, 1961, 1967, 1969, 1970, 1974, 1976, 1980, 1981, 1982, 1998, 2009, 2017 & 2021	14
5,000 – 10,000	1973, 1977, 1991, 1993, 1995, 2007 & 2008	7
10,000 – 15,000	1968, 1979, 1983, 1990 & 1999	5
15,000 – 20,000	1971, 1986, 1987 & 1988	4
Above 20,000	1978, 1984 & 2000	3

3. DETAILS OF RIVER BASINS AND SUB-BASINS

The State can be demarcated into three distinct drainage basins namely Ganga (CWC basin code no. 2A), Brahmaputra (CWC basin code no. 2B) and Subarnarekha (CWC basin code no. 6) basins respectively. Ganga basin has been further divided into two parts namely Bhagirathi lower & others and Damodar. These three main river basins can be divided into sub-basins having individual catchment of their own. Index maps of different river sub-basins and basins are presented in **Annexure-II**.

3.1. BRAHMAPUTRA BASIN

The rainfall in the northern region of the State is generally high. The ground slope is steep, particularly in the Sub-Himalayan regions of the northern districts. Most of these northern districts belong to Brahmaputra basin. This system consists of a total area of 10,584 sq. km., nearly 12% of the geographical area of the State. This basin area is interspersed with a large number of drainage channels, which join the main drainage arteries of the regions like the rivers Teesta, Torsa, Raidak, Jaldhaka etc. All these rivers originate from the Himalayas in neighboring countries Bhutan and Tibet as well as neighboring state Sikkim, flow across Terai region and reach the plains of West Bengal and then flow towards another neighboring country Bangladesh to join River Brahmaputra. The catchment area distribution of this basin and sub-basins bounded within different neighboring States and countries has been presented in the following table.

Distribution of Catchment Area of River Basins & Sub-Basins of West Bengal									
CWC Basin Code	River Basin	Sub-Basins	CATCHMENT AREA (Sq. Km.)						TOTAL (Sq. Km)
			Assam	Sikkim	West Bengal	Bangla-desh	Bhutan	Tibet	
BRAHMAPUTRA									
2B	Brahmaputra Lower	Jaldhaka		76	3916	351	959		5302
		Raidak			246		4590	16	4852
		Sankosh	175		162		9734	75	10146
		Teesta		7000	3012	12		29	10053
		Torsa			3248		2363	1581	7192
		Sub-Total	175	7,076	10,584	363	17,646	1701	37,545

3.1.1. Sankosh Sub-basin

The river Sankosh with its origin in Bhutan is the eastern most river of Brahmaputra River basin. It serves as the boundary between the two states West Bengal and Assam. It joins with Raidak-II and finally falls into Brahmaputra in Bangladesh by name Gadadhar. The length of Sankosh in West Bengal is 24 km. The total catchment area of this river sub-basin is 10,146 sq.km.

3.1.2. Raidak Sub-basin

It originates in Mt. Akungphu at an altitude of 6,400 m. in Bhutan. The river Raidak then bifurcates into two channels namely Raidak-I and Raidak-II at Bhutanghat, close to Indo-Bangladesh border. Raidak-I joins the united stream of Torsa and Kaljani, while Raidak-II is joined by Sankosh and finally outfalls into Brahmaputra in Bangladesh by the name Gadadhar. The

length of Raidak-II is around 50 km in West Bengal. The total catchment area of Raidak-II river sub-basin is 4,852 sq.km.

3.1.3. Torsa Sub-basin

The river Torsa originates in Chumbi Valley of southern Tibet at an altitude of 7,065 m. It flows through Tibet, Bhutan, West Bengal and Bangladesh. Below Hasimara Bridge on NH-31, it bifurcates into two channels namely Sil-Torsa and Char-Torsa. They reunite at PatlaKhowa forest. The river passes by the Coochbehar town and is joined by river Kaljani and Raidak-I. The combined flows outfalls into Brahmaputra near Nageswari at Rangpur in Bangladesh. The total length of this river is 222 km out of which 74 km is situated within West Bengal. The total catchment area of this river sub-basin is 7,192 sq.km.

3.1.4. Jaldhaka Sub-basin

The river Jaldhaka has its origin at Bitang Lake in Sikkim at an altitude of 4,400 m. It flows through Sikkim, Bhutan, West Bengal and Bangladesh. After the river is joined by a number of streams and tributaries; both in mountainous and sub-mountainous regions, it finally flows into river Dharala and the combined system, by the name Dharala ultimately outfalls into Brahmaputra in Bangladesh. The total length of this river is 192 km out of which 122 km is situated within West Bengal. The total catchment area of this river Sub-basin is 5,302 sq.km.

3.1.5. Teesta Sub-basin

Teesta, the mighty river of North Bengal originates in the glaciers of North Sikkim at an altitude of 6,400 m and is formed by the union of two streams viz. Lachen and Lachung at Chunthung in Sikkim. It enters West Bengal at Rangpo and upto Mechi, it forms the boundary between West Bengal and Sikkim. Two of its tributaries, Great-Rangeet and Rammam also serve as the natural boundary between the two States. The river finally outfalls into Brahmaputra in Rangpur district of Bangladesh. The total length of this river is 309 km. out of which 103 km. is situated within Sikkim and 121 km. in West Bengal. The total catchment area of this river Sub-basin is 10,053 sq. km. Under '**Teesta Barrage Project**', a barrage has been constructed at Gajoldoba in Jalpaiguri district.

3.2. GANGA BASIN

The two holy rivers - Bhagirathi and Alakananda originating from the glaciers of the Himalayas at an altitude of 7,000 m join at Devprayag and the combined stream is known as the Ganga. It emerges into the plains at Rishikesh in Uttarakhand. After flowing exclusively through Uttarakhand and Uttar Pradesh, it receives the flow of Yamuna, one of its major tributaries near Allahabad. The other major tributaries of Ganga are Ton, Gomti, Ghaghara, Son, Gandak, Kosi and Fulahar. The Ganga forms the boundary between Uttar Pradesh and Bihar for a length of about 110 km and the river then enters Bihar and flows more or less through the middle of the state. After its confluence with the Kosi, the Ganga continues its eastward flows in Bihar for about 40 km.

At Bhagalpur of Bihar, the river begins to flow south-southeast and as it enters West Bengal, the river swings round the Rajmahal hill range. It begins its attrition with the branching away of its first distributary, the Bhagirathi-Hooghly, which goes on to become the Hooghly River after meeting with Jalangi near Nabadwip and ultimately outfalls into the Bay of Bengal near Sagar Island. Just before the border with Bangladesh, the Farakka Barrage controls the flow of the Ganges, diverting some of the water into a feeder canal linked to the Hooghly for keeping it relatively silt-free.

The North-Central, South-Central, Western, Southwestern and Southern parts of West Bengal constitute the Ganga Basin. This basin is largely divided into two major sub-basins namely Bhagirathi lower and Damodar. The total length of the river Ganga from its point of origin to the point where it falls into sea is about 2,575 km. (measured along Bhagirathi and the Hooghly) of which 1,450 km. lies in Uttarakhand and Uttar Pradesh, 110 km along Uttar Pradesh and Bihar border, 445 km. in Bihar and 570 km. in West Bengal.

The Ganga system comprises a total area of 74,575 sq. km. within the state of West Bengal. The catchment area distribution of this basin and sub-basins bounded within different neighboring states and countries has been presented in the following table.

Distribution of Catchment Area of River Basins & Sub-Basins of West Bengal								
CWC Basin Code	River Basin	Sub-Basins	CATCHMENT AREA (Sq. Km)					TOTAL (Sq. Km)
			Bihar	Jharkhand	Orissa	West Bengal	Bangladesh	
GANGA								
2A	Bhagirathi and Others (Ganga Lower)	Atreyee				1627	2262	3889
		Fulahar	2940			325		2684 5949

3.2.1. Mahananda-Fulhar Sub-basin

The river Mahananda originates from Ghoom near Darjeeling town in the district of Darjeeling. It is bounded on the north by the Himalayas, in the east by the ridges separating it from Teesta river system, the river Ganga on the South and the Kosi river system in the east. The river bifurcates into two channels at Barsoi in Bihar. Out of the two branches one flows through Bihar by the name Fulahar and the other flows through West Bengal as Mahananda. The river Mahananda carrying the flow of four tributaries namely, Nagar, Kalindri, Tangon and Punarbhaba, drains into the river Ganga from the Northwestern side at Godogarighat just downstream of the point where Ganga leaves the boundary of West Bengal. The combined catchment area of these two Sub-basins is 19,342 sq. km. Under '**Teesta Barrage Project**', a barrage has been constructed over **Mahananda** near Fulbari and another pick-up barrage has been constructed over river **Dauk** near Chopra of North Dinajpur district, which is a tributary of Mahananda.

3.2.2. Atreyee Sub-basin

Some rivers like Sahu, Neem, Talma, Chaoai, Panga originating from the high lands in districts of Jalpaiguri and meet together to form Kartowa which then enters into Bangladesh by the name Atreyee. The river Atreyee then bifurcates into two channels namely Dheepa and Atreyee. The Western Channel named Atreyee re-enters into West Bengal in South Dinajpur district covering a length of 40 km in the State. It again enters into Bangladesh and ultimately outfalls into river Jamuna after passing through Chalanbeel. The total catchment area of this river sub-basin is 3,889 sq.km at the point of leaving West Bengal boundary.

3.2.3. Punarbhaba Sub-basin

The river Dheepa after emerging out from Atreyee in Bangladesh, has taken a South - Western course to enter into South Dinajpur district assuming the name Punarbhaba. Covering a length of about 40 km. in the district, it touches the eastern boundary of Malda district and finally enters into

Bangladesh. Further down, Punarbhaba meets the river Mahananda in Bangladesh. The catchment area of this sub-basin is 2,934 sq. km.

3.2.4. Nagar-Kulik, Gamari-Chiramati, Tangon Sub-basins

All these rivers flow through the districts Malda and North Dinajpur and outfall into the river Mahananda. In course of their flow, somewhere they form the boundary either between West Bengal and Bihar or between West Bengal and Bangladesh. Nagar, originating in Bangladesh flows along the boundary of West Bengal and taking a Southeastern course, receives a spill channel of Mahananda and is joined by Kulick, which has also its origin in Bangladesh.

Gamari and Chiramati (or Srimati) are two small rivers that flow through North Dinajpur district before they are united. This combined streams finally outfalls into the river Mahananda. Tangon is a tributary of river Mahananda. It rises in Bangladesh. It flows through the district of North Dinajpur and Malda and meets Mahananda on the boundary of Malda and Bangladesh. The catchment area of Tangon is 2,050 sq. km.

3.2.5. Bhagirathi-Hooghly Sub-basin

Farakka Barrage diverts water from river Ganga into Bhagirathi through a channel known as **Feeder canal** near Tildanga town of Murshidabad district in order to ensure minimum flow in Bhagirathi especially during dry season. This canal flowing parallel to Ganga passes Dhulian and ends just above Jangipur where Bhagirathi takes its own course. Two right bank tributaries namely Pagla and Bansloi outfall into the Feeder canal before it turns into actual Bhagirathi. It has been renamed as river Hooghly as it passes on the eastern side of Hooghly district until it outfalls into the Bay of Bengal near Sagar island.

During its entire course from origin to outfall, Bhagirathi has formed boundaries between the districts of Purba Bardhaman & Nadia, Hooghly & North 24-Parganas, Howrah & Kolkata, Purba Medinipur & South 24-Parganas. River Ajay, Mayurakshi, Damodar (Amta Channel), Rupnarayan and Haldi are the major tributaries on its right bank while river Jalangi and Churni are the major tributaries on its left bank. Some other minor tributaries on its right bank are Khari, Behula, Ghea and Rasulpur. Moreover, there are so many small drainage channels and khals which directly outfall into this river from its both banks thus forming local catchment areas of 5,452 sq.km. The Tolly's Nullah or the Adi-Ganga, as it is sometimes called is a small but important tidal creek draining into the river Hooghly from the left near the city of Kolkata.

One important factor that affects the drainage potential of river Hooghly is the effect of tides. The tide runs rapidly on Hooghly and produces a remarkable example of the fluvial phenomenon known as a '*tidal bore*'. This consists of the head-wave of the advancing tide, hemmed in where the estuary narrows suddenly into the river, and often exceeds 2.1 m. in height. The difference from the lowest point of low water in the dry season to the highest point of high water in the rainy season is reported to be more than 6 m. It has been observed that the incident of flood devastation in the districts

of Purba & Paschim Medinipur, Howrah and Hooghly occur mostly when high flood discharges from Jharkhand districts along-with those from Bankura, Birbhum, Paschim Bardhaman, Purba Bardhaman and Purulia districts of West Bengal synchronizes with high tides in river Hooghly specially during the month of August and September.

3.2.6. Jalangi-Bhairab Sub-basin

The river Jalangi originates from the right bank of the river Padma in Murshidabad district, 165 km. downstream of Farakka. Jalangi is dead for all purposes except during the periods of heavy rain, when it receives water from Padma. The river ends its journey by finally outfalling into the river Bhagirathi near Nabadwip town of Nadia district. The major tributary of Jalangi is river Bhairab that starts its journey from the river Ganga near Lalbag of Murshidabad district. It is now almost a dead channel but during rainy season, it receives water from Padma. Catchment area of Jalangi Sub-basin is 2,537 sq.km.

3.2.7. Mathabhanga-Churni Sub-basin

River Mathabhanga originates from the right bank of the Padma, at Munshiganj in Kushtia district of Bangladesh. It bifurcates near Majdia of Nadia in India, creating two channels. The western course, Churni runs a few km. through Nadia in a south-west direction to meet Bhagirathi and the other course Ichamati, after traversing a length of 20 km in India, enters into Bangladesh near Mubarakpur. The length of Churni is almost 56 km. Catchment area of Mathabhanga-Churni Sub-basin is 2,279 sq.km.

3.2.8. Ichamati- Bidyadhari Sub-basins

After entering into Bangladesh near Mubarakpur, river Ichamati flows for 35 km in Bangladesh and again re-enters into India at Duttaphulia of Nadia. It forms the international border between India and Bangladesh for 21 km. and finally outfalls into river Kalindi of Sundarban area. The length of Ichamati is 208 km. with the catchment area of 2,313 sq. km. within West Bengal and 1,063 sq. km. within Bangladesh. Bidyadhari originates near Haringhata in Nadia district and then flows through Deganga, Habra and Barasat areas of North 24 Parganas before joining the Raimangal River in the Sundarbans. It has been the major drainage system of North 24-Parganas and Kolkata having catchment area of 2,014 sq. km.

3.2.9. Pagla-Bansloji Sub-basins

These rivers originate from the Rajmahal hills in the Sahebganj district of Jharkhand. Flowing eastern across Birbhum district, they entered Murshidabad district as the tributaries of the river Bhagirathi. The combined catchment area of these sub-basins is 2,489 sq. km.

3.2.10. Brahamani-Dwarka Sub-basin

Dwaraka originating in Dumka district of Jharkhand, flows through Birbhum and Murshidabad districts where it joins with Mayurakshi to form Babla which finally outfalls into the river Bhagirathi. Brahamani is the main tributary of Dwarka. It also originates in Dumka district of Jharkhand and flows through Birbhum and Murshidabad districts to meet with Dwarka. There are

Baidhara and Deocha barrages across the river Brahamani and Dwarka respectively under the '**Mayurakshi Reservoir Project**'. The total catchment area of this sub-basin is 4,117 sq. km.

3.2.11. Mayurakshi-Babla Sub-basin

River Mayurakshi (or Mor), the major river in Birbhum district, has a long history of devastating floods. It has its source on Trikut hill, about 16 km from Deoghar in Jharkhand state. Several spill channels - the Manikarnika, Kana Mor etc. takeoff from the Mayurakshi in its lower reaches. All these rivers including river Dwarka flow into the lower pocket of Hijal beel in the district of Murshidabad. The combined flow when starts journey from the beel named as river Babla that finally drains into the river Bhagirathi. The ruling level of Bhagirathi considerably influences the drainage and flood level in the Hijal beel.

Massanjore dam and **Tilpara barrage** have been constructed across this river as a part of 'Mayurakshi Reservoir Project', which is the first major irrigation project in West Bengal after independence. Other important structures of this project situated in Birbhum are Kopai barrage on river Kopai and Kandisala weir over river Bakreswar. The combined flows of Kopai and Bakreswar are called river Kuia which outfalls into Mayurakhshi near Kandi of Murshidabad. Mayurakshi is about 250 km long out of which nearly 100 km passes through West Bengal. The total catchment area of this sub-basin is 5,478 sq.km. River Siddheswari and Noonbeel are two major tributaries of Mayurakshi out falling into it at 8 km downstream of Massanjore dam and largely contribute the high volume of uncontrolled flood discharge during monsoon.

3.2.12. Ajay Sub-basin

River Ajay originates on a small hill about 300 m high, southwest of Munger in Bihar. It then flows through Jharkhand and enters West Bengal at Simjuri, near Chittaranjan. It forms the border between Birbhum and Paschim-Purba Bardhaman districts and finally joins the Bhagirathi River near Katwa town of Purba Bardhaman. Total length of the Ajay is 288 km. out of which 152 km. lays in West Bengal. The important tributaries of Ajay are Pathro and Jayanti in Jharkhand, Hinglow in Birbhum and Kunur in Purba Bardhaman district of West Bengal.

There is a barrage across river Ajay constructed by Govt. of Jharkhand at Sikatia. The floods of this river are flashy and of short duration. There are some pockets in the Ajay-Kunur catchment, which suffer from frequent inundation. Large areas of Purba Bardhaman, Birbhum and Murshidabad districts experience inundation due to drainage congestion whenever flood of the Ajay coincides with those of the Mayurakshi and Dwarka. A dam has been constructed over the tributary Hinglow for the purpose of irrigation in some parts of Birbhum district. The total catchment area of this Sub-basin is 6,093 sq.km.

3.2.13. Khari-Behula-Ghea Sub-basins

Khari river a minor right bank tributary of river Bhagirathi originates from the swampy field of Kanksa-Panagarh region of Purba Bardhaman district

and flows mainly eastward and later south-eastward to outfall into river Bhagirathi upstream of Kalna town. Its main tributary is Banka River, which acts as a spill channel of river Damodar, and after flowing almost parallel to Khari, it meets with Khari just before its outfall into Bhagirathi. The catchment area of this sub-basin is 2,268 sq. km.

Behula, also a spill channel of river Damodar originates near Palla village of Purba Bardhaman district and after flowing eastward it outfalls into river Bhagirathi upstream of Balagarh town of Hooghly district. Its main tributary is Gangur river. The catchment area of this sub-basin is 549 sq. km.

Ghea is another spill channel of river Damodar, originating in the Purba Bardhaman district and after flowing southward and south-eastward through Hooghly district it outfalls into Hooghly river near Champdani town. The main tributaries of this river are Kana and Kunti having a catchment area of 1,167 sq. km.

3.2.14. Damodar-Mundeswari Sub-basins

River Damodar originating from Palamu hills in Jharkhand and flowing through a length of 541 km between several districts of Jharkhand and West Bengal bifurcates into two channels at Beguahana of Purba Bardhaman district near Jamalpur. One channel carrying dominant flood discharge has been named as river Mundeswari that drains into Rupnarayan at Bakshi of Howrah district. The other channel after passing through Hooghly and Howrah districts as Amta channel carries its discharge and outfalls into the river Hooghly through an outfall sluice near Uluberia.

The river causes floods in its lower reaches in the districts of Purba Bardhaman, Hooghly and Howrah, mainly on the right bank of the river below Beguahana. Earlier known as the '*Sorrow of Bengal*' because of its ravaging floods in the plains of West Bengal, the Damodar and its tributaries have been somewhat tamed with the construction of four dams (**Maithon, Panchet, Konar** and **Tilayia**) under the control of '**Damodar Valley Corporation (DVC)**'. There is another dam at Tenughat across Damodar under the direct control of Government of Jharkhand and in the lower catchment; there are one **barrage** at **Durgapur** and one **weir** at **Randiha** under the direct control of Irrigation & Waterways Department, Government of West Bengal.

River Barakar and Bokaro are two major tributaries of Damodar in Jharkhand which meet Damodar from its left bank whereas river Shali in Bankura district of West Bengal is another major tributary situated on its right bank. Harinkhola, Short-Cut channel, Kana Dwarakeswar, Hurrura khal are other important drainage arteries of this catchment which play important role in draining out flood discharge into river Rupnarayan, having tidal influence. The total catchment area of Damodar sub-basin in Jharkhand is 17,087 sq.km and in West Bengal is 4,325 sq. km. upto Beguahana point. The local catchment area of Mundeswari sub-basin is 1,439 sq.km and that of Amta Channel-Kana Damodar sub-basin is 1,490 sq.km.

3.2.15. Dwarakeswar Sub-basin

Dwarakeswar river (also known as Dhalkishore) is a major river in the

western part of West Bengal. It originates from Tilboni hill of Chhotanagpur Plateau in Purulia district and enters Bankura district near Chatna. It mainly flows southeastward and after entering into Hooghly district it turns south near Arambag. Its main tributary Gandheswari rising from Bankura district meets Dwarakeswar near Bankura town. After receiving contributions from other minor tributaries like Arkasha, Berai, Shankari etc. Dwarakeswar finally joins with Shilabati at Bandar near Ghatal town of Paschim Medinipur district to form river Rupnarayan. There is proposal of "Dwarakeswar-Gandheswari Reservoir Project" within this sub-basin. Catchment area of this sub-basin is 4,292 sq. km.

3.2.16. Silabati Sub-basin

Like Dwarakeswar, river Silabati (also known as Shilai) emerging from hilly terrain of Chhota Nagpur Plateau in the Purulia district, traverses south-eastward through the districts of Bankura and Paschim Medinipur to meet with Dwarakeswar to form Rupnarayan River. River Joyponda, Ketia, Donai, Kubai and Parang are major tributaries of Shilabati. There is a small pickup barrage constructed across the river at **Kadamdeuli** in Bankura district as a part of 'Kangsabati Reservoir Project'. The catchment area of this sub-basin is 4,088 sq. km.

3.2.17. Kangsabati Sub-basin

The river Kangsabati (also variously known as the Kasai and Cossye) originating from Chhota Nagpur Plateau in the Purulia district and flowing south-eastward, joins with its main tributary Kumari River at Mukutmanipur of Bankura district where a reservoir popularly known as Mukutmanipur dam has been constructed under the '**Kangsabati Reservoir Project**' for the purpose of both irrigation and flood control. An **Anicut** structure built on this river near **Midnapore** town in 1872 was also added to the operations of the project. Further down, after entering into the district of Paschim Medinipur it joins with combined streams of Bhairab Banki and Tarafeni rivers. Both the rivers have barrages over them under the Project. After travelling further east in a tortuous course, it bifurcates into two rivers at Kapastikri of Paschim Medinipur.

Northern branch, known as Old Cossye after flowing through certain distance, further bifurcates into two courses at Daspur of Paschim Medinipur. One course, named as Palaspai khal flow further east to outfall into the Rupnarayan and the main course, known as Durbachati flows southeasterly along the border of both Medinipur districts to outfall into river Rupnarayan. Old Cossye is also connected with river Silabati through a small channel known as Kanki khal.

The southern course, known as New Cossye, flows further southeasterly direction to meet with river Kaliaghai at Dheubhangal of Purba Medinipur district and forms river Haldi that flows eastwardly into the river Hooghly at Haldia. Kherai and Bakshi khal is the main tributary of river New Cossye. The total length of Kangsabati is around 465 km. The catchment area of this sub-basin is 6,645 sq.km. Very often, lower portion of this sub-basin especially Ghatal area of Paschim Medinipur and Panskura area of Purba Medinipur

districts suffer from inundation due to high flood discharge from its uncontrolled catchment downstream of the Mukutmanipur dam synchronizing with high tide in river Rupnarayan.

3.2.18. Kaliaghai Sub-basin

The river Kaliaghai trickles out from Dudhkundi of Jhargram district and flows south-easterly through Paschim and Purba Medinipur to meet the other arm of Kangsabati i.e., New Cossye to form Haldi. During the course of its journey, it is fed by the flow of its tributaries namely Kapaleswari, Baghai and Chandia. The length of this river is 121 km and catchment area is 1,913 sq. km. This river is mainly responsible for flood in Sabang area of Paschim Medinipur district.

3.2.19. Rupnarayan Sub-basin

River Rupnarayan is the major drainage artery of southwestern districts of South Bengal. Being the main tributary of Hooghly River, it receives tidal discharge of Bay of Bengal throughout the year and plays an important role in draining floodwater from vast catchment area. Irrespective of discharges from its major tributaries like Mundeswari, Darakeswar, Shilabati and Kangsabati, it also receives flood water from many local drainage channels like Kata khal of Hooghly, Bakshikhal of Howrah, Chandreswar khal of Paschim Medinipur, Denan-Dehaty-Soadighi-Gangakhali-Pratapkhal-Shankrara khals of Purba Medinipur which directly outfall into Rupnarayan from its both banks. The length of this river is 80 km having local catchment area of 1,226 sq.km.

3.2.20. Haldi Sub-basin

Two rivers New Cossye and Kaliaghai join at Dheubhangal of Purba Medinipur to form river Haldi which after traversing southeastward outfalls into river Hooghly near Haldia town. It divides the Purba Medinipur district into two parts, the Northern part can be categorized as drainage area of Tamluk and the southern part can be categorized as Rasulpur-Nandigram drainage area. Except upper catchment discharges from Kaliaghai-New Cossye sub-basins, river Haldi drains out water from parts of both the above-mentioned drainage areas. The lower portion of the river Haldi is affected by over bank spills and drainage problem during the monsoon as entire stretch of 42 km of the river falls under the tidal influence of river Hooghly. The local catchment area of this sub-basin is 614 sq.km.

3.2.21. Rasulpur Sub-basin

The river Rasulpur is formed by union of two drainage channels namely Bagda and Sadarkhals. It is the main drainage channel in Contai sub-division of Purba Medinipur district. The river having length 19 km drains out floodwater of 1,556 sq. km. into the river Hooghly.

3.2.22. Pichabani-Negua Channel Sub-basin

River Pichabani and Negua Diversion channel systems are used to discharge rainwater out from Dubda basin of Purba Medinipur district. The two channels outfall into Bay of Bengal. Catchment area of this sub-basin is 808 sq.km.

3.2.23. Sundarban Drainage Sub-basin

Apart from the rivers described earlier within the Ganga basin, there is a group of rivers in Southern part of the State, which falls in the deltaic zone. These tidal rivers, estuaries and creeks are situated on the eastern side of Hooghly River popularly known as Sundarbans, which is nothing but an intricate network of number of deltaic islands of the district of South 24-Parganas. These rivers drain off whatsoever fresh discharge comes from countrysides, thus ultimately draining into Bay of Bengal. Some important rivers in Sundarban are Muriganga, Mridangabhang, Saptamukhi, Raimangal, Matla, Bidya, Thakuran, Malancha, Kalindi, Gomar etc. The total land area of Sundarban sub-basin is 6,747 sq. km. whereas including all rivers and creeks, Sundarban has gross area of 10,209 sq. km.

3.3. SUBARNAREKHA BASIN

The river Subarnarekha (also called Swarnarekha) though it has small catchment within this state, has separate entity as it directly falls into the Bay of Bengal. Originating in the Chhotonagpur Range at an elevation of 609 m. near Ranchi, it traverses through three states viz. Jharkhand, West Bengal and Orissa. It drains out rainwater from a total area of 19,684 sq. km. out of which only 3,593 sq. km falls within Purulia, Paschim Medinipur and Jhargram districts of West Bengal.

One major dam at **Chandil** and one barrage at **Galudi** have been constructed across Subarnarekha in Jharkhand. The important tributaries on the right bank of this river are Kanchi and Karkari, which meet Subarnarekha above Chandil dam and another right bank main tributary named as Kharkai meets this river near Jamshedpur upstream of Galudi barrage. Dulung is the main tributary, which joins Subarnarekha from its left in the Jhargram district of West Bengal. The total length of this river is 395 km. out of which 83 km. falls within West Bengal.

Distribution of Catchment Area of River Basins & Sub-Basins of West Bengal						
CWC Basin Code	River Basin	Sub-Basins	CATCHMENT AREA (Sq. Km.)			TOTAL (Sq. Km)
			Jharkhand	Orissa	West Bengal	
6	SUBARNAREKHA	Subarnarekha	13014	3077	3286	19377
		Kashpal			307	307
		Sub-Total	13,014	3,077	3,593	19,684

4. HYDRO-METEOROLOGICAL DATA COLLECTION & DISSEMINATION

Irrigation and Waterways Department (IWD), Govt. of West Bengal is responsible for maintenance, collection, compilation and dissemination of hydrological and meteorological data for the purpose of monitoring of flood or flood-like situation for almost all river sub-basins of the State during monsoon. For this purpose, network of river gauges and rain gauges have been established at the important locations and during monsoon flood control rooms in each district are set up including the Central Flood Control Room (CFCR) at Jalasampad Bhavan, Salt Lake, Kolkata.

4.1. Rain and River Gauges

Apart from IWD, other organizations like Central Water Commission (CWC), India Meteorological Department (IMD), State Agricultural Department (AGRI), Kolkata Port Trust (KoPT), Damodar Valley Corporation (DVC) and Surface Water Investigation Directorate (SWID) under Water Resources Investigation & Development Department (WRIDD) have set up network of river gauges and rain gauges of their own at different locations for monitoring hydrological and meteorological data. These field data mainly include daily rainfall, water level of river and reservoir, river discharge and inflow-outflow from reservoir. In addition to that other information like inflow forecast, meteorological forecast and flood damage are also collected.

Existing Hydro-Met Monitoring Stations in the State

Type	IWD	CWC	IMD	Others
Rain Gauge Stations (ORG/ARG/AWS/FCS)	95	45	65	55
River Gauge / Discharge Stations (G/G-D/HOS)	77	81	-	144
Total	172	126	65	199
ORG = Ordinary Rain Gauge	ARG = Automatic Rain Gauge			
AWS= Automatic Weather Station	FCS = Full Climatic Station			
G=Gauge, G-D=Gauge Discharge	HMS = Hydro-Meteorological Station (Rainfall, Temperature, Wind speed, Solar radiation, Humidity, & other Weather parameters)			
HOS = Hydrological Observation Station (Gauge, Discharge, Silt/Sediment, Water Quality)				

Besides Ordinary Rain & River gauges, IWD also maintains seven (7) Gauge-Discharge stations at different rivers and fourteen (13) Hydrological Observation Stations (HOS) at Dam & Barrage sites for measurement of Reservoir levels, Inflow, Outflow, Canal discharges & sediment/silt content if requires.

Summary of Hydro-Met Stations under Irrigation and Waterways Department

Type of Hydro-Met Stations	Total number of Data collected in IWD web inventory	Published in Daily Flood Reports
Number of Rain Gauges	132	84
Number of River Gauges	84	60
Number of River Gauge & Discharge	7	7
Number of Dam & Barrage Monitoring Sites (Reservoir/Pond Level, Inflow, Outflow)	20	13

A comprehensive list of existing Hydro-Met stations within the State under the jurisdiction of Irrigation & Waterways Department, Central Water Commission and India Meteorological Department and the data recorded by Irrigation & Waterways Department, is given in **Annexure-III**.

Recently under National Hydrology Project (NHP), IWD is going to commission a 'Real Time Data Acquisition System (RTDAS)' for efficient flood forecasting and inundation modelling within the State. For this, fully automated radar and sensor type hydro-met stations proposed to be installed. Following sensors are proposed:

Sensor Type	Total No. to be installed
Automatic Rain Gauge (ARG)	69
Automatic Weather Station (AWS, including ARG)	7
Automatic Water Level Recorder (AWLR)	128
Dam-Barrage Gate Sensor (GS)	13
PAN evaporimeter (PAN)	4
Automatic Flow Meter (AFM)	19
Automatic Tide Gauge (ATG)	3

The work is conceived in three phases and two are under progress and detailed lists of those stations are given in **Annexure-III**. Besides RTDAS, IWD had also proposed two canal SCADA system for Kangsabati & Mayurakshi system under NHP.

4.2. Role of Central Flood Control Room

The present flood monitoring and management system in the State comprises with the preparation of Daily Flood Report (DFR) by Central Flood Control Room (CFCR) of IWD and transmission of the same to the State Disaster Management Department with the Head Quarter at Kolkata. Daily report is also shared with the Chief Secretary, Home Secretary of the State and other organization like Railway Authorities, Bengal Army Headquarters, CWC-Easten Zone Monitoring Office, Kolkata Port Trust (KoPT), Kolkata Municipal Corporation (KMC) and all District Magistrates of the State through e-mail.

This Daily Flood Report (DFR) generally contains rainfall, river and gauge and discharge, river warning levels/ signals, weather information, reservoir level/inflow/outflow data of different Stations within and outside the State. Sometimes the location and extent of major damages, the status of affected areas under inundation etc. are also included, as and when the situation such warrants. These

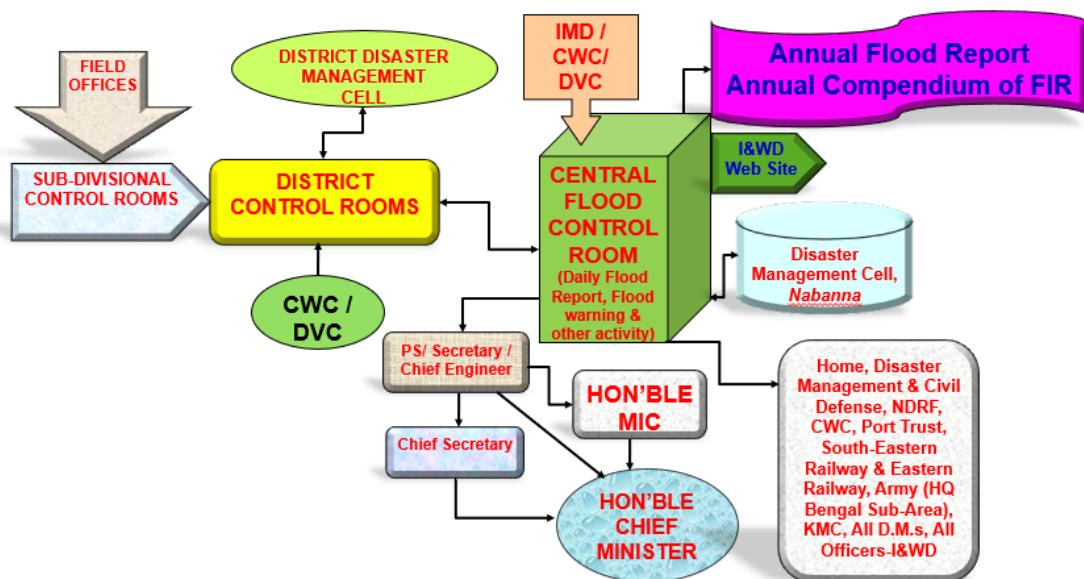

data are collected from different district flood control rooms under IWD (details given in **Annexure-XII**) along with other agencies like IMD, CWC and DVC by telephone, e-mail or WhatsApp messages. During emergency, separate Flood Bulletin is issued and the same are disseminated also to the district Disaster Management Cells and other authorities via e-mail, SMS or WhatsApp messages. Daily flood reports are also uploaded in the departmental web site: www.wbiwd.gov.in.

This year, CFCR was operational 24x7 during entire monsoon & flood season starting from 1st June, 2022 to 31st October 2022, collected raw data from all existing hydro-met stations & Dam-Barrage data from IWD's district control rooms, pertinent rainfall and weather forecast/warning from IMD websites, relevant data from CWC-Kolkata, Chandil Dam, Galudih Barrage and Sikatia Barrage data from the concerned authorities, compiled all these in the standard proforma and finally prepared the DFR for dissemination around 10.00 to 10:30 a.m.

HUMAN RESOURCE MANAGEMENT OF CFCR

FLOW DIAGRAM SHOWING DATA COLLECTION & TRANSMISSION SYSTEM

5. RAINFALL

Climatological variations are observed in West Bengal due to its physical and geographical position. The annual normal rainfall of the State is 1,836 mm, while the hilly regions at the foothills of Himalaya receive the heaviest rainfall ranging from 2500 mm to 4000 mm. The southern districts in the plains receive average of 1325 mm to 1925 mm. Main rainfall season in this state is the South-West monsoon season during which the entire State gets 76% of the annual rainfall. The Gangetic plains of West Bengal get 64% of its annual rainfall during the monsoon period distributed normally from 1st week of June to the end of September. But during last few years, some parts of West Bengal have experienced cyclone and associated heavy rainfall in the last week of May causing drainage congestion. However, the late withdrawal of monsoon has also been observed.

5.1. Normal Rainfall Pattern

The river Ganga divides the State into two parts, which are by and large homogeneous from the meteorological point of view. The northern half is designated as 'Sub-Himalayan West Bengal' and the southern half as 'Gangetic West Bengal'. Sub-Himalayan West Bengal is more susceptible to heavy rains both in respect of amount as well as in frequency of occurrence.

Very heavy rain is more frequent in first two months (June and July) than in subsequent, in the Sub-Himalayan West Bengal. In Gangetic West Bengal, the frequency is maximum in August followed by June, July and September in that order. On the basis of rainfall distribution, the State can be divided into two broad zones -(i) The Himalayan and Sub-Himalayan Region (ii) The Gangetic Plains

i) Himalayan and Sub-Himalayan Region

The Himalayan and Sub-Himalayan Region comprises the districts of Darjeeling, Kalimpong, Jalpaiguri, Alipurduar, Coochbehar and Northern part of Islampur Sub-Division of Uttar Dinajpur district of high intensity of average annual rainfall from 2000 mm to over 4000 mm, about 80% of which is found to occur during monsoon season (present annual normal rainfall of North Bengal Sector = 2479 mm). On an average, Darjeeling, Coochbehar and Jalpaiguri get 114, 112 and 110 rainy days respectively in a year.

The monsoon generally follows a northern track to ultimately break up against Eastern Himalaya causing very heavy rainfall and thereafter, trough of low pressure under break monsoon conditions. It then shifts northward to the Himalayan foothills. It has been found that a precipitation between 200 to 300 mm in two hours is not unusual.

ii) Gangetic Plains

The Gangetic plains which constitute the major portion of the State, can be further sub-divided into the following three sectors on the basis of average rainfall.

Sector-I: Bankura, Purba & Paschim Bardhaman, Hooghly, Nadia and Purulia districts which receive an average annual rainfall between 1140 mm and 1400 mm (present annual normal rainfall = 1423 mm, this is slightly higher than the upper range due to extra rainfall in winter season).

Sector-II: Birbhum, Purba & Paschim Medinipur, Jhargram, Murshidabad and North 24-Parganas having an average annual rainfall between 1400 mm and 1650 mm (present annual normal rainfall = 1553 mm).

Sector-III: Kolkata, Howrah and South 24-Parganas having an average annual rainfall - between 1650 mm and 1900 mm (present annual normal rainfall = 1768 mm).

Such regional variations in the precipitation may causes flood condition time to time.

5.2. Intensity & Spatial Distribution of Rainfall

As per Heavy Rain Warning Services of India Meteorological Department (IMD), Ministry of Earth Sciences, Govt. of India, Classification of Rainfall, Category of Rain Spell and Spatial distribution of daily Rainfall are as follows:

Classification of Rainfall Intensity			
Category	24 hours Rainfall over a station ending at 0830 Hrs IST (in mm)	Category	24 hours Rainfall over a station ending at 0830 Hrs IST (in mm)
Very Light Rain	Trace - 2.4	Heavy Rain	64.5 – 115.5
Light Rain	2.5 - 15.5	Very Heavy Rain	115.6 - 204.4
Moderate Rain	15.5 – 64.4	Extremely Heavy Rain	>= 204.5
Category of Rain Spell			
Category	Range of daily Rainfall of a Station (mm/hour)	Category	Range of daily Rainfall of a Station (mm/hour)
Light spell	10	Very Intense spell	31 - 50
Moderate spell	11 – 20	Extremely Intense spell	51 - 99
Intense spell	21 - 30	Cloud Brust	>= 100
Spatial Distribution of Rainfall			
Distribution	No. of Places	Description	
Isolated	One or two places	< 25% of stations get rainfall	
Scattered	At a few Places	(26–50) % of stations get rainfall	
Fairly Widespread	At many places	(51–75) % of stations get rainfall	
Wide spread	At most places	(76–100) % of stations get rainfall	
Dry	-	No station reported rainfall	
Weekly/Seasonal Rainfall Distribution on Regional Scale			
Large Excess	Percentage departure of realized rainfall from normal rainfall is + 60% or more.		
Excess	Percentage departure of realized rainfall from normal rainfall is between + 20% to + 59%.		
Normal	Percentage departure of realized rainfall from normal rainfall is between - 19 % to + 19 %.		
Deficient	Percentage departure of realized rainfall from normal rainfall is between - 20 % to - 59 %.		
Scanty	Percentage departure of realized rainfall from normal rainfall is between - 60 % to - 99 %.		
No Rain	Percentage departure of realized rainfall from normal rainfall is - 100 %.		
Rainfall Distribution on All India Scale			
Normal	Percentage departure of realized rainfall from normal rainfall is within $\pm 10\%$ of the Long Period Average.		
Below Normal	Percentage departure of realized rainfall from normal rainfall is < 10 % of the Long Period Average.		
Above Normal	Percentage departure of realized rainfall from normal rainfall is > 10 % of the Long Period Average.		
All India Drought Year	When the rainfall deficiency is more than 10%, and when 20 to 40% of the country is under drought conditions, then the year is termed as All India Drought Year		
All India Severe Drought Year	When the rainfall deficiency is more than 10% and when the spatial coverage of drought is more than 40%, it is called as All India Severe Drought Year.		

5.3. Monsoon 2022

As per IMD-Delhi, this year South West Monsoon had onset over Kerala on 29th May and had arrived some part of North Bengal & Sikkim on 3rd June and covered entire North Bengal on 17th June. So, entry of SW monsoon was early compared to normal. It advanced into some part of South Bengal on 18th June and covered entire West Bengal within a week. Advancement of monsoon in West Bengal is shown below:

The Sectoral variations of monthly average rainfall in West Bengal during monsoon months 2022 is given below with colour coding, which is derived from IMD's district-wise monthly rainfall data (presented in **Annexure IV-A**).

Variation of Monthly Average Rainfall (mm) of Sub-Himalayan West Bengal during Monsoon 2022

Month	June			July			August			September		
	Actual	Normal	% Dep	Actual	Normal	% Dep	Actual	Normal	% Dep	Actual	Normal	% Dep
North Bengal Sector	671.3	453.6	48.0%	331.9	615.2	-46.0%	349.0	462.9	-24.6%	302.9	398.3	-24.0%

Variation of Monthly Average Rainfall (mm) of Gangetic Plains of West Bengal during Monsoon 2022

**Raw Data Source: IMD, Kolkata

The graphical representation of district-wise monthly rainfall 2022 vis-à-vis normal rainfall are given in **Annexure IV-B**. The cumulative monthly rainfall of various Rain gauge stations for different River Sub-Basins, as observed at IWD's Central Flood Control Room during entire flood season i.e., from 1st June to 31st October, is given in **Annexure V-B**.

In North Bengal districts, the average monsoon rainfall deviation was -14.2% from its normal average i.e. NORMAL while that of South Bengal districts was -26.8% i.e. DEFICIENT. For the State as a whole, the **monsoon rainfall** as per IMD, from 1st June to 30th September 2022 was just **Deficient** with the percentage departure (i.e., deviation from its normal value) was **-19.5%**.

Average Monsoon [01.06.22-30.09.22] Rainfall (mm)			
Zone	Actual	Normal	% Dep
North Bengal	1655.00	1930.02	-14.2%
South Bengal	848.3	1159.4	-26.8%
West Bengal	1123.6	1396.3	-19.5%

The annual rainfall of the State was NORMAL with percentage departure **-15.1%** due to winter large excess rainfall. Season-wise Average Rainfall Statistics of West Bengal for the Year 2021 as per data provided by IMD, Kolkata is presented in **Annexure V-A**.

As per IMD-Delhi, the process of South-west monsoon withdrawn from West Bengal started on 15th October in North Bengal and finally withdrawn on 20th October from entire West Bengal, with a little delay. The withdrawal map is given below.

5.4. Rainfall Observed at CFCR

The DFR of CFCR, IWD contains 84 rain gauge stations, which captures daily rainfall data from 1st June to 31st October. The Number of Rainfall Day Statistics out of 12,852 data is presented below:

5.5. Annual Rainfall 2022

As defined by IMD, meteorological seasons comprising of four seasons. They are: Winter (1st January to 28th February), Pre-monsoon (1st March to 31st May), Monsoon (1st June to 30th September) and Post-monsoon (1st October to 31st December) seasons. The seasonal distribution of total annual rainfall of the State is presented below:

A district-wise visual comparison of last five years (2017-2022) average monsoon rainfall is presented in **Annexure VI**. Large multiple peaks are observed for the year 2022.

ANNUAL FLOOD REPORT, 2022

IMD, RMC, Kolkata has prepared a percentage rainfall departure map from long period average for the districts in West Bengal for winter, pre-monsoon, monsoon, and post monsoon period which are presented below:

INDIA METEOROLOGICAL DEPARTMENT RMC KOLKATA

Rainfall % Departures from the Long Period Averages
for Districts in WEST BENGAL

PERIOD : 01.01.2022 - 28.02.2022

6. FLOOD SEASON 2022

As per Govt. of India's Water Resources Information System (India-WRIS) and Central Water Commission (CWC), monsoon period comprises of five months from June to October. Accordingly, flood season in West Bengal also covers from June to October. The distribution of monthly average rainfall in the State for this season shows less rainfall than normal with average departure of -18.7% that varies from minimum deficit of -3.4% in August 2022 to maximum deficit of only -44.5% in July 2022. Thus, the overall monsoon rainfall in 2022 may be termed as Normal.

Distribution of Monthly Average Rainfall in West Bengal during Flood Season 2022

Month	Actual Rainfall (mm)	Normal Rainfall (mm)	% Departure	Remarks
June-22	284.7	309.9	-8.1%	Normal Rainfall
July-22	236.3	425.6	-44.5%	Deficient Rainfall
Aug.-22	344.0	356.0	-3.4%	Normal Rainfall
Sept.-22	258.6	304.8	-15.2%	Normal Rainfall
Oct.-22	124.1	138.4	-10.3%	Normal Rainfall

* Data source: IMD-Kolkata

Month-wise statistical analysis of River Gauges i.e. Maximum peak values, Minimum river gauges, average river stages, number of days river level crossed primary danger level (PDL) or warning level (WL), danger level (DL) and extreme danger level (EDL) and during Flood Season, 2022 is presented in **Annexure-VII**.

6.1. Flood Spells in North Bengal

6.1.1. In June 2022: Monsoon onset with significant rainfall at few places of North Bengal on 3rd & 4th June with very heavy rainfall at Hasimara, Banarhat & Malbazar. Steady rainfall noticed in the 1st and 2nd week of June with extreme rainfall from 14th to 21st June. Malbazar & Siliguri experienced maximum one day rainfall of 272 mm & 270 mm respectively on 21st. This was caused due to passing of an East-West trough from east Uttar Pradesh (UP) to Manipur across central parts of Bihar, Sub-Himalayan West Bengal (SHWB) & Sikkim and Assam at mean sea level (MSL) and strong moister incursion from Bay of Bengal (BoB). The rivers which were normally thirsty after summer, gradually raised and had crossed danger level (DL) for R. Raidak-I at Tufanganj on 17th & 19th and R. Torsa at Coochbehar on 18th June. Even R. Torsa at Hasimara & R. Kaljani at Alipurduar crossed extreme danger level (EDL) on 18th June. Another three days extreme heavy rainfall spell noticed from 27th to 29th June due to passing of a trough at MSL from UP to east Assam across Bihar, SHWB & Sikkim and strong moister incursion from BoB. R. Mansai at Mathabhanga & R. Teesta at Domohani was above DL. Yellow & Red signals for above river was imposed & withdrawn several times during the month of June. Overall monthly rainfall was 48% excess than normal.

6.1.2. In July 2022: This month is comparatively less eventful than June except month's end extremely heavy rainfall in Jalpaiguri district due to passing of Monsoon trough to the north and moisture incursion from BoB. Banarhat experienced maximum one day rainfall of 220 mm on 29th. R. Torsa, Jaldhaka & Teesta were on high stages then. Overall monthly rainfall was 46% deficient than normal.

6.1.3. In August 2022: This month is also calm. First two days heavy to very heavy rainfalls were the effect of July end's trough. R. Teesta & Jaldhaka continuously flown above DL as a result. Again, heavy to very heavy rainfalls observed at month's end. Due to monsoon rain in North India, R. Ganga-Padma at Manikchakghat in gradual spate. It had crossed DL at the end of August and continuously rising. Overall monthly rainfall was 24% deficient than normal.

6.1.4. In September 2022: It is similar to August with a significant rainfall spell at last week. Except high spate of R. Ganga-Padma at Manikchakghat, rivers were tamed.

6.1.5. In October 2022: Overall monthly rainfall was almost normal. Significant rainfall was noticed on 10-12th October. River stages were almost normal except little higher level of R. Ganga-Padma at Manikchakghat.

All monthly rainfall variations are stated in cl. 5.3 of previous chapter and also presented in **Annexure IV- A & B**. Flood frequency curves (Gauge Level vs. Time) of different rivers in entire North Bengal have been presented in **Annexure VIII-A**. Due to high river stages, warning signals were frequently imposed for unprotected & protected areas of North Bengal. List of such signals is presented in **Annexure-X**.

6.2. Flood Spells in South Bengal

6.2.1. In June & July 2022: Onset of SW monsoon in South Bengal was very late. Deficient rainfall observed in first two months. About 49% in June and 44% in July were rainfall deficit than monthly normal value. So, the South Bengal rivers were almost dry or below the measurable gauge levels.

6.2.2. In August 2022: A depression was formed over coastal Odisha on 9th August. Due to this, enhanced rainfall of South Bengal was there on 10th & 11th August. Another depression was formed over northwest BoB adjoining coastal West Bengal & North Odisha on 14th August. This triggered heavy rain on 15th August over few coastal districts of South Bengal. One deep depression was formed over coastal West Bengal & adjoining Northwest Odisha on 19th August. Under its influences, heavy to very heavy rainfall observed in South Bengal on 19th-20th August. Due to back-to-back monsoon depressions, river stages were raised and particularly Kaliaghai-Kapaleswari system ruled very high, above EDL at the last week of August (25-28th). Overall rainfall of this month was normal.

6.2.3. In September & October 2022: Rainfall pattern of these two months were almost similar, on an average 15% less rainfall than normal. Significant rainfalls were on 12-13th September. South Bengal rivers were almost under control. Cyclone 'SITRANG' formed over the BoB during 22nd to 25th October, but no such effect is observed on West Bengal.

Statistical analysis of River gauge data for whole West Bengal during the flood season 2022 is detailed in **Annexure-VII**. Flood frequency curves of different rivers in South Bengal have been presented in **Annexure VIII-B**.

6.2.4. Depression & Cyclonic Storms in 2022: Observed tracts as per IMD, of deep depression formed over BoB in the month of August and cyclone 'Sitrang' formed over BoB in the month of October are presented below side by side:-

6.3. Reservoir and Barrage Data

The instantaneous Inflow-Outflow and Reservoir level of large dams and important barrages either under the control of Irrigation & Waterways Department or those have direct impact on the flood situation of West Bengal have been measured during the flood season. Monthly Statistics of data of those Dam-Barrage Operations i.e. maximum, minimum & average reservoir level, inflow & outflow data was analyzed and presented in **Annexure IX-A**. The inflow-outflow data along-with reservoir levels of those important Dams and Barrages during 1st June to 31st October, 2022 have been graphically presented in **Annexure IX-B**.

6.4. Warning / Signal System

North Bengal Central Flood Control Room, Jalpaiguri imposes warning / signal system for protected and unprotected river banks of North Bengal during peak flood period. The details of signal imposed and later withdrawn; on receding of river levels is given in the following table. The warning signals imposed for different rivers in North Bengal for this flood season is tabulated in **Annexure-X**.

Flood Warning Levels of North Bengal Rivers

Gauge obtained from	Signal Imposed By	Name of River	Name of Gauge Station	Unprotected Area		Protected Area	
				Yellow	Red	Yellow	Red
Irrigation & Waterways Department, Government of West Bengal	JPG	Teesta	Teesta Bazar	211.00	213.00

Abbreviations: - JPG: Jalpaiguri, CBR: Coochbehar, APD: Alipurduar, SLG: Siliguri

6.5. Bhora Kotal & Tidal Surges

Significant full moon or bhora kotsals where tidal levels in river Hooghly as per Tide Table of KoPT were very high on 17.04.22, 15.07.22, 13.08.22 (highest) & 11.09.22. Due to wave thrust in purnima kotal synchronized with heavy rainfall & easterly wind in association with depression in coastal Bay of Bengal, overtopping, breach and wash out of embankments happened on 14th August, 2022. I&WD measures HTL at Sagar Island, Old Digha & Najirganj. Tidal Surge, i.e. additional rise of water (HTL) than predicted value as per KoPT tide table was observed. Due to effect of Purnima Kotal synchronized with easterly wind several damages occurred on 13-16th July, 2022. Even new moon tide had some effect on 26.10.22.

6.6. Flood Damage Data

The flood damages in the year 2022 were not so much significant. The nature and extent of damages and expenditure involved for restoration of flood damages occurred in different districts of West Bengal have been presented in **Annexure-XI**.

7. CONCLUSION

Our State is a huge recipient of run-off generated from outside of the State. It has typical basin characteristics. In the northern Sub-Himalayan region, the rainfall is high and the terrain slope is steep. The rivers in the Terai region are wide, shallow and mostly braided. Due to immense denudation of forest cover and unstable geology in the hills, the silt loads are continuously deposited in the river beds, reducing the carrying capacity of rivers. It causes overflow during high discharges, often creating flood situations. In the northern foothills, central and southern region, heavy rainfall and surface run-off descending from the upper catchments, often outside the State boundary, causes flood inundation and drainage congestion due to flat topography of the region.

Main structural measures of flood control in West Bengal are river embankments measuring about 10,500 km., spread over different river systems, constructed over the years. There are major dams across river Kangsabati, Mayurakshi and Damodar River systems. In the Damodar system, moderation of the dam release during the peak flood is possible to some extent.

In North Bengal, an elaborate flood warning system is maintained by the department that warns the common people about the trend of rise of water level in rivers and thus alarms them to take necessary precautionary measures well beforehand. In Central and South Bengal, the water level of different rivers together with their danger and extreme danger levels as well as the releases from different dams and barrages are intimated to different authorities' time to time during the entire flood season.

Besides this, our department continuously maintains close liaison with the Regional Meteorological Centre (RMC), Kolkata and keeps continuous track of India Meteorological Department (IMD) website in order to collect dynamic information on weather condition during entire monsoon period. In critical situations, the department adopts appropriate measures commensurate with the circumstances. Central Water Commission (CWC) always extend their co-operation by providing different hydro-meteorological data under their jurisdiction.

In every monsoon and flood season, Central Flood Control Room (CFCR), with toll-free landline facilities, becomes operational to keep close vigil of the situations. It functions round the clock and is always on high alert. It collects daily hydro-meteorological and climatological data from all possible sources, prepares Daily Flood Reports and Bulletins and disseminates the same to all concerned. Daily reports during entire monsoon period are also available in public domain in the departmental website www.wbiwd.gov.in. Two regional flood control rooms (RFCR) of North Bengal, one at Club Road, Jalpaiguri and another at Green Park, Malda were also functional for communicating of information in a better way.

Besides the normal monsoon period, CFCR may pre-open or re-open during extreme exigencies like, severe cyclonic storms. It continuously monitors and kept track of the development and advancement of the storm, collected data of associated rainfall, wind speed, storm surge and damages of departmental infrastructure and published special bulletins twice daily during these exigencies. It also monitors effect of Spring Tide or Bhora Kotal and corresponding Tidal Surges in Coastal Digha, Sagar-Kakdwip and Garden Reach-Najirganj regions.

In the previous year, overall annual rainfall has been below normal with few incessant spells leading to some breaches and damages to I&WD infrastructure at some places. Apart from that, damages in river and sea embankments of coastal districts have occurred due to Purnima Bhora Kotal synchronized with easterly wind. For all the situations, department has taken appropriate action for timely completion and restoration of the damaged spots.

Annexure VI: Graphical comparison of last six years average rainfall of different districts**Daily Rainfall Average of Alipurduar District for Last 6-years (2017-2022)**

(Average Daily Rainfall of Rain Gauge Stations at Barabisha & Alipurduar)

**Daily Rainfall Average of Coochbehar District for Last 6-years (2017-2022)**

(Average Daily Rainfall of Rain Gauge Stations at Mathabhanga, Coochbehar & Tufanganj)

Annexure VI: Graphical comparison of last six years average rainfall of different districts**Daily Rainfall Average of Jalpaiguri District for Last 6-years (2017-2022)**

(Average Daily Rainfall of Rain Gauge Stations at Malbazar, Jalpaiguri, Banarhat, Mainaguri & Hasimara)

**Daily Rainfall Average of Darjeeling District for Last 6-years (2017-2022)**

(Average Daily Rainfall of Rain Gauge Stations at Darjeeling & Siliguri)

Annexure VI: Graphical comparison of last six years average rainfall of different districts**Daily Rainfall Average of Uttar Dinajpur District for Last 6-years (2017-2022)**

(Average Daily Rainfall of Rain Gauge Stations at Islampur & Raiganj)

**Daily Rainfall Average of Dakshin Dinajpur District for Last 6-years (2017-2022)**

(Average Daily Rainfall of Rain Gauge Stations at Balurghat & Gangarampur)

Annexure VI: Graphical comparison of last six years average rainfall of different districts**Daily Rainfall Average of Malda District for Last 6-years (2017-2022)**

(Average Daily Rainfall of Rain Gauge Station at Englishbazar)

**Daily Rainfall Average of Murshidabad District for Last 6-years (2017-2022)**

(Average Daily Rainfall of Rain Gauge Stations at Berhampore & Kandi)

Annexure VI: Graphical comparison of last six years average rainfall of different districts

Annexure VI: Graphical comparison of last six years average rainfall of different districts**Daily Rainfall Average of Purulia District for Last 6-years (2017-2022)**

(Average Daily Rainfall of Rain Gauge Stations at Simulia, Purihansa, Tusuma, Kharidwar & Phulberia)

**Daily Rainfall Average of Jhargram District for Last 6-years (2017-2022)**

(Average Daily Rainfall of Rain Gauge Station at Jhargram)

Annexure VI: Graphical comparison of last six years average rainfall of different districts**Daily Rainfall Average of West Midnapore District for Last 6-years (2017-2022)**

(Average Daily Rainfall of Rain Gauge Stations at Amlagora, Ghatal, Midnapore, Sabang & Barisha)

**Daily Rainfall Average of East Midnapore District for Last 6-years (2017-2022)**

(Average Daily Rainfall of Rain Gauge Stations at Panskura, Tamluk, Amgachia, Itamogra, Contai & Digha)

Annexure VI: Graphical comparison of last six years average rainfall of different districts**Daily Rainfall Average of Paschim Bardhaman District for Last 6-years (2017-2022)**

(Average Daily Rainfall of Rain Gauge Stations at Satkahania, Guskara, Asansol & Durgapur)

**Daily Rainfall Average of Purba Bardhaman District for Last 6-years (2017-2022)**

(Average Daily Rainfall of Rain Gauge Stations at Katwa, Jamalpur, Kanainatsal, Memari, Seharabazar & Lohai (Raina))

Annexure VI: Graphical comparison of last six years average rainfall of different districts**Daily Rainfall Average of Hooghly District for Last 6-years (2017-2022)**

(Average Daily Rainfall of Rain Gauge Stations at Arambag, Singur, Champadanga & Tarakeswar)

**Daily Rainfall Average of Howrah District for Last 6-years (2017-2022)**

(Average Daily Rainfall of Rain Gauge Stations at Domjur & Amta)

Annexure VI: Graphical comparison of last six years average rainfall of different districts**Daily Rainfall Average of Nadia District for Last 6-years (2017-2022)**

(Average Daily Rainfall of Rain Gauge Station at Swarupganj)

**Daily Rainfall Average of Kolkata District for Last 6-years (2017-2022)**

(Average Daily Rainfall of Rain Gauge Station at Alipore)

Annexure VI: Graphical comparison of last six years average rainfall of different districts**Daily Rainfall Average of North 24 Parganas District for Last 6-years (2017-2022)**

(Average Daily Rainfall of Rain Gauge Stations at Bangaon, Tentulia & Dumdum)

**Daily Rainfall Average of South 24 Parganas District for Last 6-years (2017-2022)**

(Average Daily Rainfall of Rain Gauge Stations at Chowbaga, Uttarbhag & Sagar Island)
